## 1. Security Target Introduction

This section identifies the Security Target (ST) and Target of Evaluation (TOE) identification, ST conventions, ST conformance claims, and the ST organization. The TOE is Kyocera DuraForce PRO Mobile Device provided by Kyocera Corporation. The TOE is being evaluated as a mobile device.

The Security Target contains the following additional sections:

- Conformance Claims (Section 2)
- Security Objectives (Section 3)
- Extended Components Definition (Section 4)
- Security Requirements (Section 5)
- TOE Summary Specification (Section 6)

### Conventions

The following conventions have been applied in this document:

- Security Functional Requirements – Part 2 of the CC defines the approved set of operations that may be applied to functional requirements: iteration, assignment, selection, and refinement.
  - Iteration: allows a component to be used more than once with varying operations. In the ST, iteration is indicated by a letter placed at the end of the component. For example FDP\_ACC.1a and FDP\_ACC.1b indicate that the ST includes two iterations of the FDP\_ACC.1 requirement, a and b.
  - Assignment: allows the specification of an identified parameter. Assignments are indicated using bold and are surrounded by brackets (e.g., [**assignment**]). Note that an assignment within a selection would be identified in italics and with embedded bold brackets (e.g., [*selected-assignment*]).
  - Selection: allows the specification of one or more elements from a list. Selections are indicated using bold italics and are surrounded by brackets (e.g., [*selection*]).
  - Refinement: allows the addition of details. Refinements are indicated using bold, for additions, and strike-through, for deletions (e.g., "... **all** objects ..." or "... ~~some~~ **big** things ...").
- The NDPP uses an additional convention – the ‘case’ – which defines parts of an SFR that apply only when corresponding selections are made or some other identified conditions exist. Only the applicable cases are identified in this ST and they are identified using **bold** text.
- Other sections of the ST – Other sections of the ST use bolding to highlight text of special interest, such as captions.

### 1.1 Security Target Reference

**ST Title** – Kyocera DuraForce PRO Mobile Device (MDFPP20) Security Target

**ST Version** – Version 1.0

**ST Date** – 5 January 2017

## 1.2 TOE Reference

**TOE Identification** – Kyocera Corporation Kyocera DuraForce PRO Mobile Device

**TOE Developer** – Kyocera Corporation

**Evaluation Sponsor** – Kyocera Corporation

## 1.3 TOE Overview

The Target of Evaluation (TOE) is Kyocera DuraForce PRO Mobile Device.

The TOE is a mobile device with an operating system based on Android 6.0.1 with modifications made to increase the level of security provided to users.

## 1.4 TOE Description

The Target of Evaluation is the Kyocera DuraForce PRO smartphone which includes the Qualcomm MSM8952 processor.

The Kyocera DuraForce PRO includes a 5.0 inch, Full HD 1920x1080 resolution LCD display; a 13MP rear facing camera and 2MP front facing camera; 2GB of RAM; 32GB of built-in storage; and a microSD card slot. The Kyocera DuraForce PRO can operate on CDMA, GSM, UMTS and LTE communication networks<sup>1</sup>.

The Kyocera DuraForce PRO is a mobile device that supports individual users as well as corporate enterprises. The Kyocera DuraForce PRO is based upon Android 6.0.1 as customized by Kyocera.

The TOE provides wireless connectivity and creates a runtime environment for applications designed for the mobile Android environment. The TOE also provides telephony features (make and receive phone calls, send and receive SMS messages), networking features (connect to Wi-Fi networks, send and receive MMS messages, connect to mobile data networks).

Model	Model #	Storage	RAM	Kernel Version	Build #	Carrier Variant
DuraForce PRO	E6810	32GB	2GB	3.10.84	77f9a2518fcf54e010ac4708f980bc92	Verizon
DuraForce PRO	E6820	32GB	2GB	3.10.84	5af5d0a4566fec0b8bab756b3386c667	AT&T
DuraForce PRO	E6830	32GB	2GB	3.10.84	c0307913ad6ff1e293bf8a646988d5bd	Sprint

### 1.4.1 TOE Architecture

The TOE provides an Application Programming Interface to mobile applications and provides users installing an application to either approve or reject an application based upon the API access that the application requires

The TOE also provides users with the ability to protect Data-At-Rest (DAR) with AES encryption, including all user and mobile application data stored in the user's data partition. The TOE affords special protection to all user and application cryptographic keys stored in the TOE. Moreover, the TOE provides users the ability to AES encrypt data and files stored on an SD Card inserted into the device.

Finally, the TOE interacts with a Mobile Device Management to allow enterprise control of the configuration and operation of the device so as to ensure adherence to enterprise-wide policies.

<sup>1</sup> CDMA is available only for Sprint and Verizon variants of the mobile device.

---

#### **1.4.1.1 Physical Boundaries**

---

The TOE's physical boundary is the physical perimeter of the mobile device's enclosure.

---

#### **1.4.1.2 Logical Boundaries**

---

This section summarizes the security functions provided by DuraForce PRO:

- Cryptographic support
- User data protection
- Identification and authentication
- Security management
- Protection of the TSF
- TOE access
- Trusted path/channels

---

##### **1.4.1.2.1 Cryptographic support**

---

The TOE includes two cryptographic modules with CAVP validated algorithms for a wide range of cryptographic functions including: asymmetric key generation and establishment, symmetric key generation, encryption/decryption, cryptographic hashing and keyed-hash message authentication. These functions support random bit generation, key derivation, salt generation, initialization vector generation, secure key storage, and key and protected data destruction. These primitive cryptographic functions are used to implement security protocols such as TLS and HTTPS and also to encrypt the media (including the generation and protection of data, right, and key encryption keys) are used by the TOE. Many of these cryptographic functions are accessible as services to applications running on the TOE.

---

##### **1.4.1.2.2 User data protection**

---

The TOE controls access to system services by hosted applications, including protection of the Trust Anchor Database. Additionally, the TOE protects user and other sensitive data using encryption so that even if a device is physically lost, the data remains protected.

---

##### **1.4.1.2.3 Identification and authentication**

---

The TOE supports a number of features related to identification and authentication. From a user perspective, except for limited functions such as making phone calls to an emergency number and receiving notifications, a password (i.e., Password Authentication Factor) must be correctly entered to unlock the TOE. Also, even when the TOE is unlocked the password must be re-entered to change the password. Passwords are obscured when entered so they cannot be read from the TOE's display. The TOE limits the frequency of password entry and when a configured number of failures occurs, the TOE performs a full wipe of protected content. Passwords constructed using upper and lower cases characters, numbers, and special characters and up to 14 characters must be supported.

The TOE serves as an 802.1X supplicant and uses X509v3 certificates and perform certificate validation for a number of functions when applicable such as EAP-TLS, TLS, and HTTPS exchanges.

---

##### **1.4.1.2.4 Security management**

---

The TOE provides all the interfaces necessary to manage the security functions claimed in the corresponding Security Target (and conforming to the MDFPP requirements) as well as other functions commonly found in mobile devices. Some of the available functions are available only to the mobile device users while many are restricted to administrators operating through a Mobile Device Management solution once the TOE has been enrolled. Once the TOE has been enrolled and then un-enrolled, it issues an alert to the administrator and wipes the device to complete the unenrollment.

---

#### **1.4.1.2.5 Protection of the TSF**

---

The TOE implements a number of features designed to protect itself to ensure the reliability and integrity of its security features. It protects particularly sensitive data such as cryptographic keys so that they are not accessible or exportable. It provides a timing mechanism to ensure that reliable time information is available (e.g., for cryptographic operations and perhaps user accountability). It enforces read, write, and execute memory page protections, use address space layout randomization, and use stack-based buffer overflow protections to minimize the potential to exploit application flaws. It is also designed to protect itself from modification by applications as well as to isolate the address spaces of applications from one another to protect those applications.

The TOE includes functions to perform self-tests and software/firmware integrity checking so that it might detect when it is failing or may be corrupt. If any self-test fails, the TOE does not go into an operational mode. It also includes a mechanism (i.e., verification of the digital signature of each new image) so that the TOE itself can be updated while ensuring that the updates will not introduce malicious or other unexpected changes in the TOE. Digital signature checking also extends to verifying applications prior to their installation.

---

#### **1.4.1.2.6 TOE access**

---

The TOE is lockable, obscuring its display, by a user or after a configured interval of inactivity.

The TOE is able to attempt to connect to wireless networks as configured.

---

#### **1.4.1.2.7 Trusted path/channels**

---

The TOE supports the use of 802.11-2012, 802.1X, and EAP-TLS to secure communications channels between itself and other trusted network devices.

---

### **1.4.2 TOE Documentation**

---

Kyocera offers the following documentation to users for the installation and operation of their product. The following list of documents was examined as part of the evaluation.

[Guide]	Kyocera DuraForce PRO Common Criteria Guidance Manual, version 1.2 dated 5 January 2017.
---------	--

## 2. Conformance Claims

This TOE is conformant to the following CC specifications:

- Common Criteria for Information Technology Security Evaluation Part 2: Security functional components, Version 3.1, Revision 4, September 2012.
  - Part 2 Extended
- Common Criteria for Information Technology Security Evaluation Part 3: Security assurance components, Version 3.1 Revision 4, September 2012.
  - Part 3 Extended
- Package Claims:
  - Protection Profile For Mobile Device Fundamentals, Version 2.0, 17 September 2014 (MDFPP20)

### 2.1 Conformance Rationale

The ST conforms to the MDFPP20. As explained previously, the security problem definition, security objectives, and security requirements have been drawn from the PP.

### 3. Security Objectives

The Security Problem Definition may be found in the MDFPP20 and this section reproduces only the corresponding Security Objectives for operational environment for reader convenience. The MDFPP20 offers additional information about the identified security objectives, but that has not been reproduced here and the MDFPP20 should be consulted if there is interest in that material.

In general, the MDFPP20 has defined Security Objectives appropriate for mobile device and as such are applicable to the Kyocera DuraForce PRO Mobile Device TOE.

#### 3.1 Security Objectives for the Operational Environment

**OE.CONFIG** TOE administrators will configure the Mobile Device security functions correctly to create the intended security policy.

**OE.NOTIFY** The Mobile User will immediately notify the administrator if the Mobile Device is lost or stolen.

**OE.PRECAUTION** The Mobile User exercises precautions to reduce the risk of loss or theft of the Mobile Device.

## 4. Extended Components Definition

All of the extended requirements in this ST have been drawn from the MDFPP20. The MDFPP20 defines the following extended requirements and since they are not redefined in this ST the MDFPP20 should be consulted for more information in regard to those CC extensions.

### Extended SFRs:

- FCS\_CKM\_EXT.1: Extended: Cryptographic Key Support
- FCS\_CKM\_EXT.2: Extended: Cryptographic Key Random Generation
- FCS\_CKM\_EXT.3: Extended: Cryptographic Key Generation
- FCS\_CKM\_EXT.4: Extended: Key Destruction
- FCS\_CKM\_EXT.5: Extended: TSF Wipe
- FCS\_CKM\_EXT.6: Extended: Salt Generation
- FCS\_HTTPS\_EXT.1: Extended: HTTPS Protocol
- FCS\_IV\_EXT.1: Extended: Initialization Vector Generation
- FCS\_RBG\_EXT.1: Extended: Cryptographic Operation (Random Bit Generation)
- FCS\_SRV\_EXT.1: Extended: Cryptographic Algorithm Services
- FCS\_STG\_EXT.1: Extended: Cryptographic Key Storage
- FCS\_STG\_EXT.2: Extended: Encrypted Cryptographic Key Storage
- FCS\_STG\_EXT.3: Extended: Integrity of encrypted key storage
- FCS\_TLSC\_EXT.1: Extended: EAP TLS Protocol
- FCS\_TLSC\_EXT.2: Extended: TLS Protocol
- FDP\_ACF\_EXT.1: Extended: Security access control
- FDP\_DAR\_EXT.1: Extended: Protected Data Encryption
- FDP\_IFC\_EXT.1: Extended: Subset information flow control
- FDP\_STG\_EXT.1: Extended: User Data Storage
- FDP\_UPC\_EXT.1: Extended: Inter-TSF user data transfer protection
- FIA\_AFL\_EXT.1: Authentication failure handling
- FIA\_BLT\_EXT.1: Extended: Bluetooth User Authorization
- FIA\_PAE\_EXT.1: Extended: PAE Authentication
- FIA\_PMG\_EXT.1: Extended: Password Management
- FIA\_TRT\_EXT.1: Extended: Authentication Throttling
- FIA\_UAU\_EXT.1: Extended: Authentication for Cryptographic Operation
- FIA\_UAU\_EXT.2: Extended: Timing of Authentication
- FIA\_UAU\_EXT.3: Extended: Re-Authentication
- FIA\_X509\_EXT.1: Extended: Validation of certificates
- FIA\_X509\_EXT.2: Extended: X509 certificate authentication

- FIA\_X509\_EXT.3: Extended: Request Validation of certificates
- FMT\_MOF\_EXT.1: Extended: Management of security functions behavior
- FMT\_SMF\_EXT.1: Extended: Specification of Management Functions
- FMT\_SMF\_EXT.2: Extended: Specification of Remediation Actions
- FPT\_AEX\_EXT.1: Extended: Anti-Exploitation Services (ASLR)
- FPT\_AEX\_EXT.2: Extended: Anti-Exploitation Services (Memory Page Permissions)
- FPT\_AEX\_EXT.3: Extended: Anti-Exploitation Services (Overflow Protection)
- FPT\_AEX\_EXT.4: Extended: Domain Isolation
- FPT\_KST\_EXT.1: Extended: Key Storage
- FPT\_KST\_EXT.2: Extended: No Key Transmission
- FPT\_KST\_EXT.3: Extended: No Plaintext Key Export
- FPT\_NOT\_EXT.1: Extended: Self-Test Notification
- FPT\_TST\_EXT.1: Extended: TSF Cryptographic Functionality Testing
- FPT\_TST\_EXT.2: Extended: TSF Integrity Testing
- FPT\_TUD\_EXT.1: Extended: Trusted Update: TSF version query
- FPT\_TUD\_EXT.2: Extended: Trusted Update Verification
- FTA\_SSL\_EXT.1: Extended: TSF- and User-initiated locked state
- FTA\_WSE\_EXT.1: Extended: Wireless Network Access
- FTP\_ITC\_EXT.1: Extended: Trusted channel Communication

**Extended SARs:**

- ALC\_TSU\_EXT.1: Timely Security Updates

## 5. Security Requirements

This section defines the Security Functional Requirements (SFRs) and Security Assurance Requirements (SARs) that serve to represent the security functional claims for the Target of Evaluation (TOE) and to scope the evaluation effort.

The SFRs have all been drawn from the MDFPP20. The refinements and operations already performed in the MDFPP20 are not identified (e.g., highlighted) here, rather the requirements have been copied from the MDFPP20 and any residual operations have been completed herein. Of particular note, the MDFPP20 made a number of refinements and completed some of the SFR operations defined in the Common Criteria (CC) and that PP should be consulted to identify those changes if necessary.

The SARs are also drawn from the MDFPP20 which includes ALC\_TSU\_EXT.1. The MDFPP20 should be consulted for the assurance activity definitions.

### 5.1 TOE Security Functional Requirements

The following table identifies the SFRs that are satisfied by Kyocera DuraForce PRO Mobile Device TOE.

Requirement Class	Requirement Component
<b>FCS: Cryptographic support</b>	FCS_CKM.1(1): Cryptographic key generation
	FCS_CKM.1(2): Cryptographic key generation
	FCS_CKM.2(1): Cryptographic key establishment
	FCS_CKM.2(2): Cryptographic key distribution
	FCS_CKM_EXT.1: Extended: Cryptographic Key Support
	FCS_CKM_EXT.2: Extended: Cryptographic Key Random Generation
	FCS_CKM_EXT.3: Extended: Cryptographic Key Generation
	FCS_CKM_EXT.4: Extended: Key Destruction
	FCS_CKM_EXT.5: Extended: TSF Wipe
	FCS_CKM_EXT.6: Extended: Salt Generation
	FCS_COP.1(1): Cryptographic operation
	FCS_COP.1(2): Cryptographic operation
	FCS_COP.1(3): Cryptographic operation
	FCS_COP.1(4): Cryptographic operation
	FCS_COP.1(5): Cryptographic operation
	FCS_HTTPS_EXT.1: Extended: HTTPS Protocol
	FCS_IV_EXT.1: Extended: Initialization Vector Generation
	FCS_RBG_EXT.1: Extended: Cryptographic Operation (Random Bit Generation)
	FCS_SRV_EXT.1: Extended: Cryptographic Algorithm Services
	FCS_STG_EXT.1: Extended: Cryptographic Key Storage
FCS_STG_EXT.2: Extended: Encrypted Cryptographic Key Storage	
FCS_STG_EXT.3: Extended: Integrity of encrypted key storage	
FCS_TLSC_EXT.1: Extended: EAP TLS Protocol	
FCS_TLSC_EXT.2: Extended: TLS Protocol	
<b>FDP: User data protection</b>	FDP_ACF_EXT.1: Extended: Security access control
	FDP_DAR_EXT.1: Extended: Protected Data Encryption
	FDP_IFC_EXT.1: Extended: Subset information flow control
	FDP_STG_EXT.1: Extended: User Data Storage
	FDP_UPC_EXT.1: Extended: Inter-TSF user data transfer protection
<b>FIA: Identification and</b>	FIA_AFL_EXT.1: Authentication failure handling

<b>authentication</b>	
	FIA_BLT_EXT.1: Extended: Bluetooth User Authorization
	FIA_PAE_EXT.1: Extended: PAE Authentication
	FIA_PMG_EXT.1: Extended: Password Management
	FIA_TRT_EXT.1: Extended: Authentication Throttling
	FIA_UAU.7: Protected authentication feedback
	FIA_UAU_EXT.1: Extended: Authentication for Cryptographic Operation
	FIA_UAU_EXT.2: Extended: Timing of Authentication
	FIA_UAU_EXT.3: Extended: Re-Authentication
	FIA_X509_EXT.1: Extended: Validation of certificates
	FIA_X509_EXT.2: Extended: X509 certificate authentication
	FIA_X509_EXT.3: Extended: Request Validation of certificates
<b>FMT: Security management</b>	FMT_MOF_EXT.1: Extended: Management of security functions behavior
	FMT_SMF_EXT.1: Extended: Specification of Management Functions
	FMT_SMF_EXT.2: Extended: Specification of Remediation Actions
<b>FPT: Protection of the TSF</b>	FPT_AEX_EXT.1: Extended: Anti-Exploitation Services (ASLR)
	FPT_AEX_EXT.2: Extended: Anti-Exploitation Services (Memory Page Permissions)
	FPT_AEX_EXT.3: Extended: Anti-Exploitation Services (Overflow Protection)
	FPT_AEX_EXT.4: Extended: Domain Isolation
	FPT_KST_EXT.1: Extended: Key Storage
	FPT_KST_EXT.2: Extended: No Key Transmission
	FPT_KST_EXT.3: Extended: No Plaintext Key Export
	FPT_NOT_EXT.1: Extended: Self-Test Notification
	FPT_STM.1: Reliable time stamps
	FPT_TST_EXT.1: Extended: TSF Cryptographic Functionality Testing
	FPT_TST_EXT.2: Extended: TSF Integrity Testing
	FPT_TUD_EXT.1: Extended: Trusted Update: TSF version query
	FPT_TUD_EXT.2: Extended: Trusted Update Verification
<b>FTA: TOE access</b>	FTA_SSL_EXT.1: Extended: TSF- and User-initiated locked state
	FTA_WSE_EXT.1: Extended: Wireless Network Access
<b>FTP: Trusted path/channels</b>	FTP_ITC_EXT.1: Extended: Trusted channel Communication

Table 5-1 TOE Security Functional Components

## 5.1.1 Cryptographic support (FCS)

### 5.1.1.1 Cryptographic key generation (FCS\_CKM.1(1))

#### FCS\_CKM.1(1).1

The TSF shall generate asymmetric cryptographic keys in accordance with a specified cryptographic key generation algorithm

- *[RSA schemes using cryptographic key sizes of 2048-bit or greater that meet the following: [ANSI X9.31-1998, Section 4.1],*
- *[ECC schemes] using [NIST curves' P-256, P-384 and [no other curves] that meet the following: FIPS PUB 186-4, 'Digital Signature Standard (DSS)', Appendix B.4];*

- *FFC schemes using cryptographic key sizes of 2048-bit or greater that meet the following: FIPS PUB 186-4, 'Digital Signature Standard (DSS)', Appendix B.1].*

---

#### 5.1.1.2 Cryptographic key generation (FCS\_CKM.1(2))

---

##### FCS\_CKM.1(2).1

The TSF shall generate symmetric cryptographic keys in accordance with a specified cryptographic key generation algorithm [PRF-384] and specified cryptographic key sizes [128 bits] using a Random Bit Generator as specified in FCS\_RBG\_EXT.1 that meet the following: [IEEE 802.11-2012].

---

#### 5.1.1.3 Cryptographic key establishment (FCS\_CKM.2(1))

---

##### FCS\_CKM.2(1).1

The TSF shall perform cryptographic key establishment in accordance with a specified cryptographic key establishment method:

- *[RSA-based key establishment schemes that meets the following: NIST Special Publication 800-56B, 'Recommendation for Pair-Wise Key Establishment Schemes Using Integer Factorization Cryptography',*
- *Elliptic curve-based key establishment schemes that meets the following: [NIST Special Publication 800-56A, 'Recommendation for Pair-Wise Key Establishment Schemes Using Discrete Logarithm Cryptography'],*
- *Finite field-based key establishment schemes that meets the following: NIST Special Publication 800-56A, 'Recommendation for Pair-Wise Key Establishment Schemes Using Discrete Logarithm Cryptography']* for the purposes of encrypting sensitive data received while the device is locked. (TD0048 applied)

---

#### 5.1.1.4 Cryptographic key distribution (FCS\_CKM.2(2))

---

##### FCS\_CKM.2(2).1

The TSF shall decrypt Group Temporal Key (GTK) in accordance with a specified cryptographic key distribution method [AES Key Wrap in an EAPOL-Key frame] that meets the following: [NIST SP 800-38F, IEEE 802.11-2012 for the packet format and timing considerations] and does not expose the cryptographic keys.

---

#### 5.1.1.5 Extended: Cryptographic Key Support (FCS\_CKM\_EXT.1)

---

##### FCS\_CKM\_EXT.1.1

The TSF shall support a [*hardware-isolated*] REK with a [*symmetric*] key of strength [*256 bits*]. (TD0038 applied)

##### FCS\_CKM\_EXT.1.2

System software on the TSF shall be able only to request [*encryption/decryption, NIST SP 800-108 key derivation*] by the key and shall not be able to read, import, or export a REK. (TD0038 applied)

##### FCS\_CKM\_EXT.1.3

A REK shall be generated by a RBG in accordance with FCS\_RBG\_EXT.1.

---

#### 5.1.1.6 Extended: Cryptographic Key Random Generation (FCS\_CKM\_EXT.2)

---

##### FCS\_CKM\_EXT.2.1

All DEKs shall be randomly generated with entropy corresponding to the security strength of AES key sizes of [*256*] bits.

---

#### 5.1.1.7 Extended: Cryptographic Key Generation (FCS\_CKM\_EXT.3)

---

##### FCS\_CKM\_EXT.3.1

The TSF shall use [*128-bit, 256-bit symmetric KEKs*] corresponding to at least the security strength of the keys encrypted by the KEK. (TD0038 applied)

### FCS\_CKM\_EXT.3.2

The TSF shall generate all KEKs using one or more of the following methods:

- a) derive the KEK from a Password Authentication Factor using PBKDF and [
- b) **generate the KEK using an RBG that meets this profile (as specified in FCS\_RBG\_EXT.1),**
- c) **generate the KEK using a key generation scheme that meets this profile (as specified in FCS\_CKM.1(1)) (Per TD0038),**
- d) **Combine the KEK from other KEKs in a way that preserves the effective entropy of each factor by [encrypting one key with another] (Per TD0038).**

---

### 5.1.1.8 Extended: Key Destruction (FCS\_CKM\_EXT.4)

---

#### FCS\_CKM\_EXT.4.1

The TSF shall destroy cryptographic keys in accordance with the specified cryptographic key destruction methods:

- by clearing the KEK encrypting the target key,
  - in accordance with the following rules:
    - o For volatile memory, the destruction shall be executed by a single direct overwrite [**consisting of zeroes**]. (TD0028 applied)
    - o For non-volatile EEPROM, the destruction shall be executed by a single direct overwrite consisting of a pseudo random pattern using the TSF's RBG (as specified in FCS\_RBG\_EXT.1), followed a read-verify.
    - o For non-volatile flash memory that is not wear-leveled, the destruction shall be executed [**by a block erase that erases the reference to memory that stores data as well as the data itself**]. (TD0057 applied)
    - o For non-volatile flash memory that is wear-leveled, the destruction shall be executed [**by a block erase**].
    - o For non-volatile memory other than EEPROM and flash, the destruction shall be executed by overwriting three or more times with a random pattern that is changed before each write.
- (TD0047 applied)

#### FCS\_CKM\_EXT.4.2

The TSF shall destroy all plaintext keying material and critical security parameters when no longer needed.

---

### 5.1.1.9 Extended: TSF Wipe (FCS\_CKM\_EXT.5)

---

#### FCS\_CKM\_EXT.5.1

The TSF shall wipe all protected data by [**Cryptographically erasing the encrypted DEKs and/or the KEKs in non-volatile memory by following the requirements in FCS\_CKM\_EXT.4.1;**]

#### FCS\_CKM\_EXT.5.2

The TSF shall perform a power cycle on conclusion of the wipe procedure.

---

### 5.1.1.10 Extended: Salt Generation (FCS\_CKM\_EXT.6)

---

#### FCS\_CKM\_EXT.6.1

The TSF shall generate all salts using a RBG that meets FCS\_RBG\_EXT.1.

---

### 5.1.1.11 Cryptographic operation (FCS\_COP.1(1))

---

#### FCS\_COP.1(1).1

The TSF shall perform [encryption/decryption] in accordance with a specified cryptographic algorithm

- AES-CBC (as defined in FIPS PUB 197, and NIST SP 800-38A) mode,
  - AES-CCMP (as defined in FIPS PUB 197, NIST SP 800-38C and IEEE 802.11-2012), and [**AES-GCM (as defined in NIST SP 800-38D)**]
- and cryptographic key sizes 128-bit key sizes and [**256-bit key sizes**].

---

#### 5.1.1.12 Cryptographic operation (FCS\_COP.1(2))

---

##### FCS\_COP.1(2).1

The TSF shall perform [cryptographic hashing] in accordance with a specified cryptographic algorithm SHA-1 and [*SHA-256, SHA-384*] and message digest sizes 160 and [*256, 384*] that meet the following: [FIPS Pub 180-4].

---

#### 5.1.1.13 Cryptographic operation (FCS\_COP.1(3))

---

##### FCS\_COP.1(3).1

The TSF shall perform [cryptographic signature services (generation and verification)] in accordance with a specified cryptographic algorithm

- [RSA schemes] using cryptographic key sizes [of 2048-bit or greater] that meet the following: [

- FIPS PUB 186-4, 'Digital Signature Standard (DSS)', Section 4] and

- [*- [ECDSA schemes] using ['NIST curves' P-256, P-384 and [no other curves]] that meet the following: [FIPS PUB 186-4, 'Digital Signature Standard (DSS)', Section 5];*].

---

#### 5.1.1.14 Cryptographic operation (FCS\_COP.1(4))

---

##### FCS\_COP.1(4).1

The TSF shall perform [keyed-hash message authentication] in accordance with a specified cryptographic algorithm HMAC-SHA-1 and [*HMAC-SHA-256, HMAC-SHA-384*] and cryptographic key sizes [*160, 256, 384*] and message digest sizes 160 and [*256, 384*] bits that meet the following: [FIPS Pub 198-1, 'The Keyed-Hash Message Authentication Code', and FIPS Pub 180-4, 'Secure Hash Standard'].

---

#### 5.1.1.15 Cryptographic operation (FCS\_COP.1(5))

---

##### FCS\_COP.1(5).1

The TSF shall perform [Password-based Key Derivation Functions] in accordance with a specified cryptographic algorithm [HMAC-*[SHA-1, SHA-256]*], with [*10,000*] iterations, and output cryptographic key sizes [*256*] that meet the following: [NIST SP 800-132].

---

#### 5.1.1.16 Extended: HTTPS Protocol (FCS\_HTTPS\_EXT.1)

---

##### FCS\_HTTPS\_EXT.1.1

The TSF shall implement the HTTPS protocol that complies with RFC 2818.

##### FCS\_HTTPS\_EXT.1.2

The TSF shall implement HTTPS using TLS (FCS\_TLSC\_EXT.2).

##### FCS\_HTTPS\_EXT.1.3

The TSF shall notify the application and [*not establish the connection*] if the peer certificate is deemed invalid.

---

#### 5.1.1.17 Extended: Initialization Vector Generation (FCS\_IV\_EXT.1)

---

##### FCS\_IV\_EXT.1.1

The TSF shall generate IVs in accordance with **MDFPP20** Table 14: References and IV Requirements for NIST-approved Cipher Modes.

---

#### 5.1.1.18 Extended: Cryptographic Operation (Random Bit Generation) (FCS\_RBG\_EXT.1)

---

##### FCS\_RBG\_EXT.1.1

The TSF shall perform all deterministic random bit generation services in accordance with NIST Special Publication 800-90A using [*CTR\_DRBG (AES)*]. (TD0079 applied)

##### FCS\_RBG\_EXT.1.2

The deterministic RBG shall be seeded by an entropy source that accumulates entropy from [*TSF-hardware-based noise source*] with a minimum of [*256 bits*] of entropy at least equal to the

greatest security strength (according to NIST SP 800-57) of the keys and hashes that it will generate.

#### FCS\_RBG\_EXT.1.3

The TSF shall be capable of providing output of the RBG to applications running on the TSF that request random bits.

---

### 5.1.1.19 Extended: Cryptographic Algorithm Services (FCS\_SRV\_EXT.1)

---

#### FCS\_SRV\_EXT.1.1

The TSF shall provide a mechanism for applications to request the TSF to perform the following cryptographic operations:

- All mandatory and [(per TD0059) selected algorithms] in FCS\_CKM.2(1),
- The following algorithms in FCS\_COP.1(1): AES-CBC, [no other modes]
- All mandatory and selected algorithms in FCS\_COP.1(3)
- All mandatory and selected algorithms in FCS\_COP.1(2)
- All mandatory and selected algorithms in FCS\_COP.1(4)
- [- All mandatory and [(per TD0059) selected algorithms] in FCS\_CKM.1(1)
- The selected algorithms in FCS\_COP.1(5).

---

### 5.1.1.20 Extended: Cryptographic Key Storage (FCS\_STG\_EXT.1)

---

#### FCS\_STG\_EXT.1.1

The TSF shall provide [*hardware-isolated*] secure key storage for asymmetric private keys and [*symmetric keys*].

#### FCS\_STG\_EXT.1.2

The TSF shall be capable of importing keys/secrets into the secure key storage upon request of [*the user*] and [*applications running on the TSF*].

#### FCS\_STG\_EXT.1.3

The TSF shall be capable of destroying keys/secrets in the secure key storage upon request of [*the user*].

#### FCS\_STG\_EXT.1.4

The TSF shall have the capability to allow only the application that imported the key/secret the use of the key/secret. Exceptions may only be explicitly authorized by [*a common application developer*].

#### FCS\_STG\_EXT.1.5

The TSF shall allow only the application that imported the key/secret to request that the key/secret be destroyed. Exceptions may only be explicitly authorized by [*a common application developer*].

---

### 5.1.1.21 Extended: Encrypted Cryptographic Key Storage (FCS\_STG\_EXT.2)

---

#### FCS\_STG\_EXT.2.1

The TSF shall encrypt all DEKs and KEKs and [*long-term trusted channel key material*] by KEKs that are [

- 1) *Protected by the REK with [encryption by a KEK chaining to a REK],*
- 2) *Protected by the REK and the password with [encryption by a KEK chaining to a REK and the password-derived KEK].*

#### FCS\_STG\_EXT.2.2

DEKs and KEKs and [*long-term trusted channel key material*] shall be encrypted using one of the following methods: [*using a SP800-56B key establishment scheme, using AES in the [CBC mode]*]. (TD0038 applied)

---

### 5.1.1.22 Extended: Integrity of encrypted key storage (FCS\_STG\_EXT.3)

---

#### FCS\_STG\_EXT.3.1

The TSF shall protect the integrity of any encrypted DEKs and KEKs and [*no other keys*] by [*[GCM] cipher mode for encryption according to FCS\_STG\_EXT.2; or a hash (FCS\_COP.1(2)) of the stored key that is encrypted by a key protected by FCS\_STG\_EXT.2*].

### FCS\_STG\_EXT.3.2

The TSF shall verify the integrity of the [*hash*] of the stored key prior to use of the key.

---

#### 5.1.1.23 Extended: EAP TLS Protocol (FCS\_TLSC\_EXT.1)

---

##### FCS\_TLSC\_EXT.1.1

The TSF shall implement TLS 1.0 and [*TLS 1.1 (RFC 4346)*] supporting the following ciphersuites:

- Mandatory Ciphersuites:
  - o TLS\_RSA\_WITH\_AES\_128\_CBC\_SHA as defined in RFC 5246
- [*Optional Ciphersuites:*
  - o TLS\_RSA\_WITH\_AES\_256\_CBC\_SHA as defined in RFC 5246,
  - o TLS\_DHE\_RSA\_WITH\_AES\_128\_CBC\_SHA as defined in RFC 5246,
  - o TLS\_DHE\_RSA\_WITH\_AES\_256\_CBC\_SHA as defined in RFC 5246 ].

##### FCS\_TLSC\_EXT.1.2

The TSF shall verify that the server certificate presented for EAP-TLS [*chains to one of the specified CAs*].

##### FCS\_TLSC\_EXT.1.3

The TSF shall not establish a trusted channel if the peer certificate is invalid.

##### FCS\_TLSC\_EXT.1.4

The TSF shall support mutual authentication using X.509v3 certificates.

---

#### 5.1.1.24 Extended: TLS Protocol (FCS\_TLSC\_EXT.2)

---

##### FCS\_TLSC\_EXT.2.1

The TSF shall implement TLS 1.2 (RFC 5246) supporting the following ciphersuites:

- Mandatory Ciphersuites:
  - o TLS\_RSA\_WITH\_AES\_128\_CBC\_SHA as defined in RFC 5246
- [*Optional Ciphersuites:*
  - o TLS\_RSA\_WITH\_AES\_256\_CBC\_SHA as defined in RFC 5246,
  - o TLS\_DHE\_RSA\_WITH\_AES\_128\_CBC\_SHA as defined in RFC 5246,
  - o TLS\_DHE\_RSA\_WITH\_AES\_256\_CBC\_SHA as defined in RFC 5246,
  - o TLS\_ECDHE\_RSA\_WITH\_AES\_128\_CBC\_SHA as defined in RFC 4492,
  - o TLS\_ECDHE\_RSA\_WITH\_AES\_256\_CBC\_SHA as defined in RFC 4492,
  - o TLS\_ECDHE\_ECDSA\_WITH\_AES\_128\_CBC\_SHA as defined in RFC 4492,
  - o TLS\_ECDHE\_ECDSA\_WITH\_AES\_256\_CBC\_SHA as defined in RFC 4492,
  - o TLS\_RSA\_WITH\_AES\_128\_CBC\_SHA256 as defined in RFC 5246,
  - o TLS\_RSA\_WITH\_AES\_256\_CBC\_SHA256 as defined in RFC 5246,
  - o TLS\_DHE\_RSA\_WITH\_AES\_128\_CBC\_SHA256 as defined in RFC 5246,
  - o TLS\_DHE\_RSA\_WITH\_AES\_256\_CBC\_SHA256 as defined in RFC 5246,
  - o TLS\_ECDHE\_ECDSA\_WITH\_AES\_128\_CBC\_SHA256 as defined in RFC 5289,
  - o TLS\_ECDHE\_ECDSA\_WITH\_AES\_256\_CBC\_SHA384 as defined in RFC 5289,
  - o TLS\_ECDHE\_ECDSA\_WITH\_AES\_128\_GCM\_SHA256 as defined in RFC 5289,
  - o TLS\_ECDHE\_ECDSA\_WITH\_AES\_256\_GCM\_SHA384 as defined in RFC 5289 ].

##### FCS\_TLSC\_EXT.2.2

The TSF shall verify that the presented identifier matches the reference identifier according to RFC 6125.

##### FCS\_TLSC\_EXT.2.3

The TSF shall not establish a trusted channel if the peer certificate is invalid.

##### FCS\_TLSC\_EXT.2.4

The TSF shall support mutual authentication using X.509v3 certificates.

##### FCS\_TLSC\_EXT.2.5

The TSF shall present the Supported Elliptic Curves Extension in the Client Hello with the following NIST curves: [*secp256r1, secp384r1, secp521r1*] and no other curves.

#### FCS\_TLSC\_EXT.2.6

This optional element was not selected.

#### FCS\_TLSC\_EXT.2.7

This optional element was not selected.

#### FCS\_TLSC\_EXT.2.8

The TSF shall include [*TLS\_EMPTY\_RENEGOTIATION\_INFO\_SCSV ciphersuite*] in the ClientHello message.

---

### 5.1.2 User data protection (FDP)

---

#### 5.1.2.1 Extended: Security access control (FDP\_ACF\_EXT.1)

##### FDP\_ACF\_EXT.1.1

The TSF shall provide a mechanism to restrict the system services that are accessible to an application.

##### FDP\_ACF\_EXT.1.2

The TSF shall provide an access control policy that prevents [*groups of application processes*] from accessing [*all*] data stored by other [*groups of application processes*]. Exceptions may only be explicitly authorized for such sharing by [*a common application developer*].

---

#### 5.1.2.2 Extended: Protected Data Encryption (FDP\_DAR\_EXT.1)

##### FDP\_DAR\_EXT.1.1

Encryption shall cover all protected data.

##### FDP\_DAR\_EXT.1.2

Encryption shall be performed using DEKs with AES in the [*GCM*] mode with key size [*256*] bits.

---

#### 5.1.2.3 Extended: Subset information flow control (FDP\_IFC\_EXT.1)

##### FDP\_IFC\_EXT.1.1

The TSF shall [*provide an interface to VPN clients to enable all IP traffic (other than IP traffic required to establish the VPN connection) to flow through the IPsec VPN client*].

---

#### 5.1.2.4 Extended: User Data Storage (FDP\_STG\_EXT.1)

##### FDP\_STG\_EXT.1.1

The TSF shall provide protected storage for the Trust Anchor Database.

---

#### 5.1.2.5 Extended: Inter-TSF user data transfer protection (FDP\_UPC\_EXT.1)

##### FDP\_UPC\_EXT.1.1

The TSF provide a means for non-TSF applications executing on the TOE to use TLS, HTTPS, Bluetooth BR/EDR, and [*Bluetooth LE*] to provide a protected communication channel between the non-TSF application and another IT product that is logically distinct from other communication channels, provides assured identification of its end points, protects channel data from disclosure, and detects modification of the channel data.

##### FDP\_UPC\_EXT.1.2

The TSF shall permit the non-TSF applications to initiate communication via the trusted channel.

---

### 5.1.3 Identification and authentication (FIA)

---

#### 5.1.3.1 Authentication failure handling (FIA\_AFL\_EXT.1)

##### FIA\_AFL\_EXT.1.1

The TSF shall detect when a configurable positive integer within [**1 and 10**] of unsuccessful authentication attempts occur related to last successful authentication by that user.

##### FIA\_AFL\_EXT.1.2

When the defined number of unsuccessful authentication attempts has been surpassed, the TSF shall perform wipe of all protected data.

##### FIA\_AFL\_EXT.1.3

The TSF shall maintain the number of unsuccessful authentication attempts that have occurred upon power off.

---

#### 5.1.3.2 Extended: Bluetooth User Authorization (FIA\_BLT\_EXT.1)

##### FIA\_BLT\_EXT.1.1

The TSF shall require explicit user authorization before pairing with a remote Bluetooth device.

---

#### 5.1.3.3 Extended: PAE Authentication (FIA\_PAE\_EXT.1)

##### FIA\_PAE\_EXT.1.1

The TSF shall conform to IEEE Standard 802.1X for a Port Access Entity (PAE) in the 'Supplicant' role.

---

#### 5.1.3.4 Extended: Password Management (FIA\_PMG\_EXT.1)

##### FIA\_PMG\_EXT.1.1

The TSF shall support the following for the Password Authentication Factor:

1. Passwords shall be able to be composed of any combination of [**upper and lower case letters**], numbers, and special characters: [**“!**”, **“@”**, **“#”**, **“\$”**, **“%”**, **“^”**, **“&”**, **“\*”**, **“(“**, **“)”**];
2. Password length up to [**16**] characters shall be supported.

---

#### 5.1.3.5 Extended: Authentication Throttling (FIA\_TRT\_EXT.1)

##### FIA\_TRT\_EXT.1.1

The TSF shall limit automated user authentication attempts by [**enforcing a delay between incorrect authentication attempts**]. The minimum delay shall be such that no more than 10 attempts can be attempted per 500 milliseconds.

---

#### 5.1.3.6 Protected authentication feedback (FIA\_UAU.7)

##### FIA\_UAU.7.1

The TSF shall provide only [obscured feedback to the device's display] to the user while the authentication is in progress.

---

#### 5.1.3.7 Extended: Authentication for Cryptographic Operation (FIA\_UAU\_EXT.1)

##### FIA\_UAU\_EXT.1.1

The TSF shall require the user to present the Password Authentication Factor prior to decryption of protected data and encrypted DEKs, KEKs and [**long-term trusted channel key material**] at startup.

---

### 5.1.3.8 Extended: Timing of Authentication (FIA\_UAU\_EXT.2)

---

#### FIA\_UAU\_EXT.2.1

The TSF shall allow [f

- *take screen shots (automatically named and stored internally by the TOE),*
- *enter password to unlock*
- *make an emergency call,*
- *receive an emergency call,*
- *take pictures (stored internally) – unless the camera was disabled*
- *turn the TOE off,*
- *restart the TOE,*
- *enable ECO mode*
- *enable or disable airplane mode,*
- *turn on Do Not Disturb mode,*
- *turn Wi-Fi and Bluetooth off and on,*
- *see notifications<sup>2</sup>*
- *configure sound/vibrate/mute,*
- *set the volume,*
- *use the camera,*
- *use the voice recorder]*

on behalf of the user to be performed before the user is authenticated.

#### FIA\_UAU\_EXT.2.2

The TSF shall require each user to be successfully authenticated before allowing any other TSF-mediated actions on behalf of that user.

---

### 5.1.3.9 Extended: Re-Authentication (FIA\_UAU\_EXT.3)

---

#### FIA\_UAU\_EXT.3.1

The TSF shall require the user to enter the correct Password Authentication Factor when the user changes the Password Authentication Factor, and following TSF- and user-initiated locking in order to transition to the unlocked state, and [*no other conditions*].

---

### 5.1.3.10 Extended: Validation of certificates (FIA\_X509\_EXT.1)

---

#### FIA\_X509\_EXT.1.1

The TSF shall validate certificates in accordance with the following rules:

- RFC 5280 certificate validation and certificate path validation.
- The certificate path must terminate with a certificate in the Trust Anchor Database.
- The TSF shall validate a certificate path by ensuring the presence of the basicConstraints extension and that the CA flag is set to TRUE for all CA certificates.
- The TSF shall validate the revocation status of the certificate using [*a Certificate Revocation List (CRL) as specified in RFC 5759*].
- The TSF shall validate the extendedKeyUsage field according to the following rules:
  - o Certificates used for trusted updates and executable code integrity verification shall have the Code Signing purpose (id-kp 3 with OID 1.3.6.1.5.5.7.3.3) in the extendedKeyUsage field.
  - o Server certificates presented for TLS shall have the Server Authentication purpose (id-kp 1 with OID 1.3.6.1.5.5.7.3.1) in the extendedKeyUsage field.
  - o (Conditional) Server certificates presented for EST shall have the CMC Registration Authority (RA) purpose (id-kp-cmcRA with OID 1.3.6.1.5.5.7.3.28) in the extendedKeyUsage field.

---

<sup>2</sup> Some notifications identify actions, for example to view a screenshot; however, selecting those notifications highlights the password prompt and require the password to access that data.

**FIA\_X509\_EXT.1.2**

The TSF shall only treat a certificate as a CA certificate if the basicConstraints extension is present and the CA flag is set to TRUE.

**5.1.3.11 Extended: X509 certificate authentication (FIA\_X509\_EXT.2)**

**FIA\_X509\_EXT.2.1**

The TSF shall use X.509v3 certificates as defined by RFC 5280 to support authentication for EAP-TLS exchanges, and [*TLS, HTTPS*], and [*no additional uses*].

**FIA\_X509\_EXT.2.2**

When the TSF cannot establish a connection to determine the validity of a certificate, the TSF shall [*not accept the certificate*].

**5.1.3.12 Extended: Request Validation of certificates (FIA\_X509\_EXT.3)**

**FIA\_X509\_EXT.3.1**

The TSF shall provide a certificate validation service to applications.

**FIA\_X509\_EXT.3.2**

The TSF shall respond to the requesting application with the success or failure of the validation.

**5.1.4 Security management (FMT)**

**5.1.4.1 Extended: Management of security functions behavior (FMT\_MOF\_EXT.1)**

**FMT\_MOF\_EXT.1.1**

The TSF shall restrict the ability to perform the functions in column 3 of ~~Table 4~~ Table 5-2 Security Management Functions to the user.

**FMT\_MOF\_EXT.1.2**

The TSF shall restrict the ability to perform the functions in column 5 of ~~Table 4~~ Table 5-2 Security Management Functions to the administrator when the device is enrolled and according to the administrator-configured policy.

**5.1.4.2 Extended: Specification of Management Functions (FMT\_SMF\_EXT.1)**

**FMT\_SMF\_EXT.1.1**

The TSF shall be capable of performing the ~~following management~~ functions: **in column 2 of Table 5-2 Security Management Functions.**

**FMT\_SMF\_EXT.1.2**

**The TSF shall be capable of allowing the administrator to perform the functions in column 4 of Table 5-2 Security Management Functions.**

**Table 5-2 Security Management Functions**

Management Function	FMT_SMF_EXT.1.1	FMT_MOF_EXT.1.1	FMT_SMF_EXT.1.2	FMT_MOF_EXT.1.2
<div style="border: 1px solid black; padding: 5px; width: fit-content; margin: auto;"> <b>Status Markers:</b>                      M – Mandatory                      I – Implemented                 </div>				
1. configure password policy: <ul style="list-style-type: none"> <li>a) minimum password length</li> <li>b) minimum password complexity</li> <li>c) maximum password lifetime</li> </ul>	M	-	M	M

<p>The administrator can configure the required password characteristics (minimum length, complexity, and lifetime) using the Android MDM APIs.</p>				
<p>2. configure session locking policy:  a) screen-lock enabled/disabled  b) screen lock timeout  c) number of authentication failures</p> <p>The administrator can configure the session locking policy using the Android MDM APIs. The user can also adjust each of the session locking policies; however, if set by the administrator, the user can only set a more strict policy (e.g., setting the device to allow fewer authentication failures than configured by the administrator).</p>	M	-	M	M
<p>3. enable/disable the VPN protection:  a. across device  [ c. <i>no other method</i>]</p> <p>The user can configure and then enable the TOE's VPN to protect traffic.</p> <p>The administrator (through an MDM Agent that utilizes the TOE's MDM APIs) can restrict the TOE's ability to connect to a VPN.</p>	M	-	-	-
<p>4. enable/disable [<b>Wifi, Bluetooth, NFC, GPS and Cellular radios</b>]</p> <p>The administrator can disable the radios using the TOE's MDM APIs. Once disabled, a user cannot enable the radio. The TOE's radio's operate at frequencies of 2.4 GHz (NFC/Bluetooth), 2.4/5 GHz (Wi-Fi), and 850 MHz (4G/LTE).</p>	M	-	-	-
<p>5. enable/disable [<b>camera, microphone</b>]:  b. across device  [ c. <i>no other method</i>]</p> <p>An administrator may configure the TOE (through an MDM agent utilizing the TOE's MDM APIs) to turn off the camera and or microphones. If the administrator has disabled either the camera or the microphones, then the user cannot use those capture devices.</p>	M	-	M	M
<p>6. specify wireless networks (SSIDs) to which the TSF may connect <sup>3</sup></p> <p>An administrator can specify a list of wireless network SSIDs to which the TOE may connect and can restrict the TOE to only allow a connection to the specified SSIDs.</p>	M	-	M	-
<p>7. configure security policy for each wireless network:  c. [<i>specify the CA(s) from which the TSF will accept WLAN authentication server certificate(s)</i>]  d. security type  e. authentication protocol  f. client credentials to be used for authentication</p> <p>Both users and administrators (using the TOE's MDM APIs) can define wireless connection policies for specific SSIDs.</p>	M	-	M	-
<p>8. transition to the locked state</p> <p>Both users and administrators (using the TOE's MDM APIs) can transition the TOE into a locked state.</p>	M	-	M	-
<p>9. wipe of protected data</p> <p>Both users and administrators (using the TOE's MDM APIs) can force the TOE to</p>	M	-	M	-

<sup>3</sup> Changed from Mandatory to Optional per TD0064.

perform a full wipe (factory reset) of data.				
10. configure application installation policy by [ <i>a. restricting the sources of applications</i> ]  The administrator using the TOE's MDM APIs can configure the TOE so that the sources for applications is restricted (e.g., only from Google Market Place).	M	-	M	M
11. import keys/secrets into the secure key storage  Only users can import secret keys into the secure key storage.	M	I	-	-
12. destroy imported keys/secrets and [ <i>no other keys/secrets</i> ] in the secure key storage  Only users can destroy secret keys in the secure key storage.	M	I	-	-
13. import X.509v3 certificates into the Trust Anchor Database  Both users and administrators (using the TOE's MDM APIs) can import X.509v3 certificates into the Trust Anchor Database.	M	-	M	-
14. remove imported X.509v3 certificates and [ <i>all other X.509v3 certificates</i> ] in the Trust Anchor Database  Users can remove imported X.509v3 certificates from the Trust Anchor Database as well as disable any of the TOE's X509v3 CA certificates (a default root CA certificate may still resides in the TOE's read-only system partition; however, the TOE will treat that Root CA certificate and any certificate chaining to it as untrusted).	M	-	-	-
15. enroll the TOE in management  TOE users can enroll the TOE in management according to the instructions specific to a given MDM. Presumably any enrollment would involve at least some user functions (e.g., install an MDM agent application) on the TOE prior to enrollment.	M	M	-	-
16. remove applications  Users and administrators (using the TOE's MDM APIs) can uninstall applications on the TOE.	M	-	M	-
17. update system software  Users and administrators (using the TOE's MDM APIs) can check for updates and cause the device to update if an update is available. A wide range of possibilities exist for the administrator since and using the MDM APIs the administrator can query the version of the TOE and installed applications and an MDM agent on the TOE could issues pop-ups, initiate updates, block communication, etc. until any necessary updates are completed.	M	-	M	-
18. install applications  Users and administrators (using the TOE's MDM APIs) can install applications on the TOE.	M	-	M	-
19. remove Enterprise applications  Users and administrators (using the TOE's MDM APIs) can uninstall applications on the TOE.	M	-	M	-
20. configure the Bluetooth trusted channel: g. disable/enable the Discoverable mode (for BR/EDR) h. change the Bluetooth device name [ <i>c. no other Bluetooth configuration</i> ]  TOE users can enable Bluetooth discoverable mode for a short period of time and can also change the device name which is used for the Bluetooth name. Additional wireless technologies include Android Beam which are related to NFC and can be enabled and	M	-	-	-

disabled by the TOE user.				
21. enable/disable display notification in the locked state of: [ f. <b>all notifications</b> ]	M	-	-	-
TOE users can configure the TOE to allow or disallow notifications while in a locked state.				
22. enable/disable all data signaling over [assignment: list of externally accessible hardware ports]	-	-	-	-
23. enable/disable [assignment: <i>list of protocols where the device acts as a server</i> ]	-	-	-	-
24. enable/disable developer modes	-	-	-	-
25. enable data-at rest protection	I	-	I	-
26. enable removable media's data-at-rest protection	I	-	I	-
27. enable/disable bypass of local user authentication	-	-	-	-
28. wipe Enterprise data	-	-	-	-
29. approve [selection: <i>import, removal</i> ] by applications of X.509v3 certificates in the Trust Anchor Database	-	-	-	-
30. configure whether to establish a trusted channel or disallow establishment if the TSF cannot establish a connection to determine the validity of a certificate	-	-	-	-
31. enable/disable the cellular protocols used to connect to cellular network base stations	-	-	-	-
32. read audit logs kept by the TSF	-	-	-	-
33. configure [selection: <i>certificate, public-key</i> ] used to validate digital signature on applications	-	-	-	-
34. approve exceptions for shared use of keys/secrets by multiple applications	-	-	-	-
35. approve exceptions for destruction of keys/secrets by applications that did not import the key/secret	-	-	-	-
36. configure the unlock banner	-	-	-	-
37. configure the auditable items	-	-	-	-
38. retrieve TSF-software integrity verification values	-	-	-	-
39. enable/disable [selection: a. <i>USB mass storage mode</i> , b. <i>USB data transfer without user authentication</i> , c. <i>USB data transfer without authentication of the connecting system</i> ]	-	-	-	-
40. enable/disable backup to [selection: <i>locally connected system, remote system</i> ]	-	-	-	-
41. enable/disable [selection: d. <i>Hotspot functionality authenticated by [selection: pre-shared key, passcode, no authentication]</i> , e. <i>USB tethering authenticated by [selection: pre-shared key, passcode, no authentication]</i> ]	-	-	-	-
42. approve exceptions for sharing data between [selection: <i>application processes, groups of application processes</i> ]	-	-	-	-
43. place applications into application process groups based on [assignment: <i>application characteristics</i> ]	-	-	-	-
44. enable/disable location services: a. <u>across device</u> [ c. <b>no other method</b> ]	M	-	M	-
Users and administrators (using the TOE's MDM APIs) can enable or disable the location services offered by the TOE.				
45. [assignment: <i>list of other management functions to be provided by the TSF</i> ]	-	-	-	-

---

### 5.1.4.3 Extended: Specification of Remediation Actions (FMT\_SMF\_EXT.2)

---

#### FMT\_SMF\_EXT.2.1

The TSF shall offer [*alert the administrator and performs a factory reset of the device*] upon unenrollment and [*no other triggers*].

---

## 5.1.5 Protection of the TSF (FPT)

---

### 5.1.5.1 Extended: Anti-Exploitation Services (ASLR) (FPT\_AEX\_EXT.1)

---

#### FPT\_AEX\_EXT.1.1

The TSF shall provide address space layout randomization (ASLR) to applications.

#### FPT\_AEX\_EXT.1.2

The base address of any user-space memory mapping will consist of at least 8 unpredictable bits.

---

### 5.1.5.2 Extended: Anti-Exploitation Services (Memory Page Permissions) (FPT\_AEX\_EXT.2)

---

#### FPT\_AEX\_EXT.2.1

The TSF shall be able to enforce read, write, and execute permissions on every page of physical memory.

---

### 5.1.5.3 Extended: Anti-Exploitation Services (Overflow Protection) (FPT\_AEX\_EXT.3)

---

#### FPT\_AEX\_EXT.3.1

TSF processes that execute in a non-privileged execution domain on the application processor shall implement stack-based buffer overflow protection.

---

### 5.1.5.4 Extended: Domain Isolation (FPT\_AEX\_EXT.4)

---

#### FPT\_AEX\_EXT.4.1

The TSF shall protect itself from modification by untrusted subjects.

#### FPT\_AEX\_EXT.4.2

The TSF shall enforce isolation of address space between applications.

---

### 5.1.5.5 Extended: Key Storage (FPT\_KST\_EXT.1)

---

#### FPT\_KST\_EXT.1.1

The TSF shall not store any plaintext key material in readable non-volatile memory.

---

### 5.1.5.6 Extended: No Key Transmission (FPT\_KST\_EXT.2)

---

#### FPT\_KST\_EXT.2.1

The TSF shall not transmit any plaintext key material outside the security boundary of the TOE.

---

### 5.1.5.7 Extended: No Plaintext Key Export (FPT\_KST\_EXT.3)

---

#### FPT\_KST\_EXT.3.1

The TSF shall ensure it is not possible for the TOE user(s) to export plaintext keys.

---

### 5.1.5.8 Extended: Self-Test Notification (FPT\_NOT\_EXT.1)

---

#### FPT\_NOT\_EXT.1.1

The TSF shall transition to non-operational mode and [*no other actions*] when the following types of failures occur:

- failures of the self-test(s)
- TSF software integrity verification failures
- [*no other failures*].

---

### 5.1.5.9 Reliable time stamps (FPT\_STM.1)

---

#### FPT\_STM.1.1

The TSF shall be able to provide reliable time stamps for its own use.

---

### 5.1.5.10 Extended: TSF Cryptographic Functionality Testing (FPT\_TST\_EXT.1)

---

#### FPT\_TST\_EXT.1.1

The TSF shall run a suite of self-tests during initial start-up (on power on) to demonstrate the correct operation of all cryptographic functionality.

---

### 5.1.5.11 Extended: TSF Integrity Testing (FPT\_TST\_EXT.2)

---

#### FPT\_TST\_EXT.2.1

The TSF shall verify the integrity of the bootchain up through the Application Processor OS kernel, and [*all executable code stored in mutable media*], stored in mutable media prior to its execution through the use of [*a hardware-protected hash*].

---

### 5.1.5.12 Extended: Trusted Update: TSF version query (FPT\_TUD\_EXT.1)

---

#### FPT\_TUD\_EXT.1.1

The TSF shall provide authorized users the ability to query the current version of the TOE firmware/software.

#### FPT\_TUD\_EXT.1.2

The TSF shall provide authorized users the ability to query the current version of the hardware model of the device.

#### FPT\_TUD\_EXT.1.3

The TSF shall provide authorized users the ability to query the current version of installed mobile applications.

---

### 5.1.5.13 Extended: Trusted Update Verification (FPT\_TUD\_EXT.2)

---

#### FPT\_TUD\_EXT.2.1

The TSF shall verify software updates to the Application Processor system software and [*baseband processor software*] using a digital signature by the manufacturer prior to installing those updates.

#### FPT\_TUD\_EXT.2.2

The TSF shall [*update only by verified software*] the TSF boot integrity [*key*].

#### FPT\_TUD\_EXT.2.3

The TSF shall verify that the digital signature verification key used for TSF updates [*matches a hardware-protected public key*].

#### FPT\_TUD\_EXT.2.4

The TSF shall verify mobile application software using a digital signature mechanism prior to installation.

---

## 5.1.6 TOE access (FTA)

---

---

### 5.1.6.1 Extended: TSF- and User-initiated locked state (FTA\_SSL\_EXT.1)

---

#### FTA\_SSL\_EXT.1.1

The TSF shall transition to a locked state after a time interval of inactivity.

#### FTA\_SSL\_EXT.1.2

The TSF shall transition to a locked state after initiation by either the user or the administrator.

#### FTA\_SSL\_EXT.1.3

The TSF shall, upon transitioning to the locked state, perform the following operations:

- a) clearing or overwriting display devices, obscuring the previous contents;
- b) [*no other actions*].

### 5.1.6.2 Extended: Wireless Network Access (FTA\_WSE\_EXT.1)

#### FTA\_WSE\_EXT.1.1

The TSF shall be able to attempt connections to wireless networks specified as acceptable networks as configured by the administrator in FMT\_SMF\_EXT.1.

### 5.1.7 Trusted path/channels (FTP)

#### 5.1.7.1 Extended: Trusted channel Communication (FTP\_ITC\_EXT.1)

##### FTP\_ITC\_EXT.1.1

The TSF shall use 802.11-2012, 802.1X, and EAP-TLS and [*TLS, HTTPS protocol*] to provide a communication channel between itself and another trusted IT product that is logically distinct from other communication channels, provides assured identification of its end points, protects channel data from disclosure, and detects modification of the channel data.

##### FTP\_ITC\_EXT.1.2

The TSF shall permit the TSF to initiate communication via the trusted channel.

##### FTP\_ITC\_EXT.1.3

The TSF shall initiate communication via the trusted channel for wireless access point connections, administrative communication, configured enterprise connections, and [*no other connections*].

## 5.2 TOE Security Assurance Requirements

The SARs for the TOE are the components as specified in Part 3 of the Common Criteria. Note that the SARs have effectively been refined with the assurance activities explicitly defined in association with both the SFRs and SARs.

Requirement Class	Requirement Component
<b>ADV: Development</b>	ADV_FSP.1: Basic functional specification
<b>AGD: Guidance documents</b>	AGD_OPE.1: Operational user guidance
	AGD_PRE.1: Preparative procedures
<b>ALC: Life-cycle support</b>	ALC_CMC.1: Labelling of the TOE
	ALC_CMS.1: TOE CM coverage
	ALC_TSU_EXT.1: Timely Security Updates
<b>ATE: Tests</b>	ATE_IND.1: Independent testing - conformance
<b>AVA: Vulnerability assessment</b>	AVA_VAN.1: Vulnerability survey

Table 5-3 Assurance Components

### 5.2.1 Development (ADV)

#### 5.2.1.1 Basic functional specification (ADV\_FSP.1)

##### ADV\_FSP.1.1d

The developer shall provide a functional specification.

##### ADV\_FSP.1.2d

The developer shall provide a tracing from the functional specification to the SFRs.

##### ADV\_FSP.1.1c

The functional specification shall describe the purpose and method of use for each SFR-enforcing and SFR-supporting TSFI.

##### ADV\_FSP.1.2c

The functional specification shall identify all parameters associated with each SFR-enforcing and SFR-supporting TSFI.

**ADV\_FSP.1.3c**

The functional specification shall provide rationale for the implicit categorisation of interfaces as SFR-non-interfering.

**ADV\_FSP.1.4c**

The tracing shall demonstrate that the SFRs trace to TSFIs in the functional specification.

**ADV\_FSP.1.1e**

The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

**ADV\_FSP.1.2e**

The evaluator shall determine that the functional specification is an accurate and complete instantiation of the SFRs.

---

## 5.2.2 Guidance documents (AGD)

### 5.2.2.1 Operational user guidance (AGD\_OPE.1)

---

**AGD\_OPE.1.1d**

The developer shall provide operational user guidance.

**AGD\_OPE.1.1c**

The operational user guidance shall describe, for each user role, the user-accessible functions and privileges that should be controlled in a secure processing environment, including appropriate warnings.

**AGD\_OPE.1.2c**

The operational user guidance shall describe, for each user role, how to use the available interfaces provided by the TOE in a secure manner.

**AGD\_OPE.1.3c**

The operational user guidance shall describe, for each user role, the available functions and interfaces, in particular all security parameters under the control of the user, indicating secure values as appropriate.

**AGD\_OPE.1.4c**

The operational user guidance shall, for each user role, clearly present each type of security-relevant event relative to the user-accessible functions that need to be performed, including changing the security characteristics of entities under the control of the TSF.

**AGD\_OPE.1.5c**

The operational user guidance shall identify all possible modes of operation of the TOE (including operation following failure or operational error), their consequences and implications for maintaining secure operation.

**AGD\_OPE.1.6c**

The operational user guidance shall, for each user role, describe the security measures to be followed in order to fulfil the security objectives for the operational environment as described in the ST.

**AGD\_OPE.1.7c**

The operational user guidance shall be clear and reasonable.

**AGD\_OPE.1.1e**

The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

---

### 5.2.2.2 Preparative procedures (AGD\_PRE.1)

---

**AGD\_PRE.1.1d**

The developer shall provide the TOE including its preparative procedures.

**AGD\_PRE.1.1c**

The preparative procedures shall describe all the steps necessary for secure acceptance of the delivered TOE in accordance with the developer's delivery procedures.

**AGD\_PRE.1.2c**

The preparative procedures shall describe all the steps necessary for secure installation of the TOE

and for the secure preparation of the operational environment in accordance with the security objectives for the operational environment as described in the ST.

**AGD\_PRE.1.1e**

The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

**AGD\_PRE.1.2e**

The evaluator shall apply the preparative procedures to confirm that the TOE can be prepared securely for operation.

---

### 5.2.3 Life-cycle support (ALC)

---

#### 5.2.3.1 Labelling of the TOE (ALC\_CMC.1)

**ALC\_CMC.1.1d**

The developer shall provide the TOE and a reference for the TOE.

**ALC\_CMC.1.1c**

The TOE shall be labelled with its unique reference.

**ALC\_CMC.1.1e**

The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

---

#### 5.2.3.2 TOE CM coverage (ALC\_CMS.1)

**ALC\_CMS.1.1d**

The developer shall provide a configuration list for the TOE.

**ALC\_CMS.1.1c**

The configuration list shall include the following: the TOE itself; and the evaluation evidence required by the SARs.

**ALC\_CMS.1.2c**

The configuration list shall uniquely identify the configuration items.

**ALC\_CMS.1.1e**

The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

---

#### 5.2.3.3 Timely Security Updates (ALC\_TSU\_EXT.1)

**ALC\_TSU\_EXT.1.1d**

The developer shall provide a description in the TSS of how timely security updates are made to the TOE.

**ALC\_TSU\_EXT.1.1c**

The description shall include the process for creating and deploying security updates for the TOE software/firmware.

**ALC\_TSU\_EXT.1.2c**

The description shall express the time window as the length of time, in days, between public disclosure of a vulnerability and the public availability of security updates to the TOE.

**ALC\_TSU\_EXT.1.3c**

The description shall include the mechanisms publicly available for reporting security issues pertaining to the TOE.

**ALC\_TSU\_EXT.1.1e**

The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

---

## 5.2.4 Tests (ATE)

---

### 5.2.4.1 Independent testing - conformance (ATE\_IND.1)

#### ATE\_IND.1.1d

The developer shall provide the TOE for testing.

#### ATE\_IND.1.1c

The TOE shall be suitable for testing.

#### ATE\_IND.1.1e

The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

#### ATE\_IND.1.2e

The evaluator shall test a subset of the TSF to confirm that the TSF operates as specified.

---

## 5.2.5 Vulnerability assessment (AVA)

---

### 5.2.5.1 Vulnerability survey (AVA\_VAN.1)

#### AVA\_VAN.1.1d

The developer shall provide the TOE for testing.

#### AVA\_VAN.1.1c

The TOE shall be suitable for testing.

#### AVA\_VAN.1.1e

The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

#### AVA\_VAN.1.2e

The evaluator shall perform a search of public domain sources to identify potential vulnerabilities in the TOE.

#### AVA\_VAN.1.3e

The evaluator shall conduct penetration testing, based on the identified potential vulnerabilities, to determine that the TOE is resistant to attacks performed by an attacker possessing Basic attack potential.

## 6. TOE Summary Specification

This chapter describes the security functions:

- Cryptographic support
- User data protection
- Identification and authentication
- Security management
- Protection of the TSF
- TOE access
- Trusted path/channels

### 6.1 Cryptographic support

The TOE includes several cryptographic providers each of which provides certain cryptographic capabilities in support of various security features. The TOE implements cryptographic algorithms in accordance with the following NIST standards and has received CAVP algorithm certificates as shown in the following table.

The TOE includes the Mocana Crypto Library (MSS), and the FIPS OpenSSL library (OpenSSL). The cells marked with “Not Used” indicates that the TOE does not use that capability in the specified cryptographic provider. For example, RSA, ECDSA and DSA are used in the TOE to support TLS communications, while the MSS is used to provide Data-At-Rest and SD Card protections. Since Data-At-Rest and SD Card protections do not use RSA, ECDSA or DSA, the TOE does not use the MSS implementations of RSA, ECDSA or DSA.

The TOE includes the BoringSSL library, however, it provides functionality only for non-evaluated features such as the native VPN. The cryptographic functionality normally provided by BoringSSL library in Android 6.0.1 has been replaced by Kyocera with the OpenSSL library version 1.0.2f, using FIPS OpenSSL version 2.0.12. The version of the Mocana Crypto Library used within the TOE is version 5.5.1f.

**Table 6-1 Cryptographic Algorithms, Providers and CAVP Certificates**

Algorithm	NIST Standard	SFR Reference	Provider	Cert#
AES 128/256 bit CBC and GCM modes	FIPS 197, SP 800-38A/C/E	FCS_COP.1(1)	MSS	AES 2741
			OpenSSL	AES 4076
AES Key Wrap	SP 800-38F IEEE 802.11-2012	FCS_CKM.2(2)	OpenSSL	AES 4076
SHS SHA-1/256/384	FIPS 180-4	FCS_COP.1(2)	MSS	SHS 2313
			OpenSSL	SHS 3358
RSA SIG(gen), SIG(ver), Key(gen) 2048-bits	ANSI X9.31 FIPS 186-4	FCS_CKM.1(1) FCS_CKM.2(1) FCS_COP.1(3)	MSS	Not Used by TOE
			OpenSSL	RSA 2208
ECDSA PKG, PV, SigGen, SigVer, P-256, P-384	FIPS 186-4	FCS_CKM.1(1) FCS_CKM.2(1) FCS_COP.1(3)	MSS	Not Used by TOE
			OpenSSL	ECDSA 921
DSA Sig(gen), SIG(ver),	FIPS 186-4	FCS_CKM.1(1)	MSS	Not Used by TOE

Algorithm	NIST Standard	SFR Reference	Provider	Cert#
Key(GEN)			OpenSSL	DSA 1105
HMAC SHA-1 HMAC SHA-256/384	FIPS 198-1 & 180-4	FCS_COP.1(4)	MSS	HMAC 1718
			OpenSSL	HMAC 2662
PBKDF	NIST SP 800-132  <b>No NIST CAVP test available</b>	FCS_COP.1(5)	MSS	No Cert Possible

DRBG	SP 800-90A	FCS_RBG_EXT.1	MSS AES-256 CTR_DRBG	DRBG 460
			OpenSSL AES-256 CTR_DRBG	DRBG 1224
CVL FCC ECC	SP 800-56A	FCS_CKM.2(1)	MSS	Not Used
			OpenSSL	CVL 898 and CVL 896

The Cryptographic support function is designed to satisfy the following security functional requirements:

- **FCS\_CKM.1(1):** The TOE provides asymmetric key generation for DH, RSA, DHE/DSA and ECDH/ECDSA. The TOE generates RSA, DH/ECDH, and ECDSA (including P-256, and P-384) keys in its OpenSSL software library (which generates the keys in accordance with FIPS 186-2/ANSI X9.31). The TOE supports generating keys with a security strength of 112-bits and larger, thus supports 2048-bit RSA and DH keys, and 256-bit ECDH keys. The TOE utilizes generated DH/ECDH when acting as a TLS Client and the TOE provides mobile applications HTTP/TLS APIs as well as general cryptographic APIs (to generate RSA and ECDSA key pairs).
- **FCS\_CKM.1(2):** The TOE adheres to 802.11-2012 for key generation. The TOE's wpa\_supplicant provides the PRF384 for WPA2 derivation of 128-bit AES Temporal Key and also employs its OpenSSL AES-256 DRBG when generating random values use in the EAP-TLS and 802.11 4-way handshake. The TOE has been designed for compliance, and the Device has successfully completed certification (including WPA2 Personal) and received a WiFi CERTIFIED Interoperability Certificate from the WiFi Alliance (Certification ID: Cert # WFA65506). The WiFi Alliance maintains a website providing further information about the testing program: <http://www.wi-fi.org/certification>.
- **FCS\_CKM.2(1):** The TOE supports RSA (800-56B), DHE (FFC 800-56A), and ECDHE (ECC 800-56A) methods in TLS key establishment/exchange (the sole secure channel the TOE provides). The user and administrator need take no special configuration of the TOE as the TOE automatically generates the keys needed for negotiated TLS ciphersuite. Because the TOE only acts as a TLS client, the TOE only performs 800-56B encryption (specifically the encryption of the Pre-Master Secret using the Server's RSA public key) when participating in TLS\_RSA\_\* based TLS handshakes. Thus, the TOE does not perform 800-56B decryption. However, the TOE's TLS client correctly handles other cryptographic errors (for example, invalid checksums, incorrect certificate types, corrupted certificates) by sending a TLS fatal alert.
- **FCS\_CKM.2(2):** The TOE adheres to RFC 3394, SP 800-38F, and 802.11-2012 standards and unwraps the GTK (sent encrypted with the WPA2 KEK using AES Key Wrap in an EAPOL-Key frame). The TOE, upon receiving an EAPOL frame, will subject the frame to a number of checks (frame length, EAPOL version, frame payload size, EAPOL-Key type, key data length, EAPOL-Key CCMP descriptor version, and replay counter) to ensure a proper EAPOL message and then decrypt the GTK using the KEK, thus ensuring that it does not expose the Group Temporal Key (GTK).

- **FCS\_CKM\_EXT.1:** The TOE includes a hardware-based, 256-bit Secondary Hardware Key (SHK)<sup>4</sup> that is provided by fuses on the processor. The fuses are written once when the device is first initialized using data from the hardware DRBG provided by the processor. The SHK is the device’s Root Encryption Key (REK). The REK is used to derive keys (w/ SP 800-108 CMAC) for Data-At-Rest (DAR) protection, SD Card protection, AuthToken HMAC validation and the KeyMaster keystore. The REK is never entered, read, exported, or updated after it is initialized. The only operations allowed by or performed on the REK is key derivation using SP 800-108 (CMAC).
- **FCS\_CKM\_EXT.2:** For DAR protection, the TOE defines a DAR\_DEK which is the data encryption key protecting data-at-rest. This DAR\_DEK is a 256-bit AES key, generated from the Mocana Crypto Library CTR\_DRBG that meets FCS\_RBG\_EXT.1. The DAR\_DEK is encrypted by an ephemeral key (and AES-GCM-256) that has been created from a key (DAR\_RDK) chaining to the REK and a temporary value derived from PBKDF2 with HMAC-SHA-256 per FCS\_COP.1(5) on the user password.

For SD card protection, the TOE uses a per-file FEK to encrypt file data stored on an SD card using AES-GCM-256. The FEK is a 256-bit key generated from the Mocana Crypto Library CTR\_DRBG meeting FCS\_RBG\_EXT.1. The FEK is encrypted, using AES-GCM-256, by a FEKEK (256-bit) that is specific to a specific user and SD-card. The FEKEK is also generated from the Mocana Crypto Library CTR\_DRBG. The FEKEK is protected by the FEKEKEK (which is a KEY protected by the user’s password and a key chaining to the REK) by encrypting the FEKEK using AES-GCM-256. The user’s password is used to create a temporary value using PBKDF2, with 10,000 iterations and HMAC-SHA-1. The temporary value is encrypted by the SD\_RDK to create a 256-bit ephemeral key known as the FEKEKEK. The

Other DEKs include WPA2 keys used in wireless WPA2 EAP-TLS (which are 256 bit AES keys), HTTPS/TLS session keys (128/256 bit AES keys), Bluetooth keys (128 bit AES keys), and mobile application keys (2048 bit RSA keys). These other DEKs are generated using the FIPS OpenSSL library DRBG.

Since both the Mocana and OpenSSL DRBGs are an AES-CTR-256 based SP 800-90A DRBG, the strength of the keys requested is equal to the strength of the keys used for encryption/decryption.

- **FCS\_CKM\_EXT.3:** The TOE derives all DEKs and KEKs as defined Table 6-2. The TOE uses a NIST 800-108 (CMAC) key derivation function to derive keys used for the DAR functionality, the SD card encryption functionality and to the key store functionality which chain from the REK.

**Table 6-2 Keys**

Key Name	Key Type	Usage	Algorithm / Size	Generated From / Derived from
DAR RDK	KEK	Encrypt / decrypt IK1	256-bit AES CBC	Generated from SHK using NIST SP 800-108 (CMAC)
SD RDK	KEK	Encrypt / decrypt FEKEKEK	256-bit AES CBC	Generated from SHK using NIST SP 800-108 (CMAC)
KeyMaster RDK	KEK	Encrypt / decrypt private keys and symmetric keys	256-bit AES CBC	Generated from SHK using NIST SP 800-108 (CMAC)
DAR_DEK	DEK	Encrypt / Decrypt user data (DAR_DEK)	256-bit AES GCM	Generated from Mocana CTR_DRBG
FEK (SD Card )	DEK	SD Card per file data encryption/decryption key (FEK)	256-bit AES GCM	Generated from Mocana CTR_DRBG

<sup>4</sup> The SHK is Qualcomm terminology. Common Criteria requirements refer to this as a Root Encryption Key (REK).

FEKEK (SD Card)	KEK	SD Card per card key encryption/decryption key (FEKEK)	256-bit AES GCM	Generated from Mocana CTR_DRBG
FEKEKEK (SD Card)	KEK	SD Card per user key encryption/decryption key (FEKEKEK)	256-bit AES GCM	PBKDF2 of user password with 10,000 iterations of HMAC-SHA1
WPA2 keys	DEK	Encrypt/decryption Wi-Fi/802.11 communications	nonces	PBKDF2 of pre-shared key and SSID with 4096 iterations of HMAC-SHA1
TLS/HTTPS session keys	DEK	Encryption/decryption of TLS/HTTPS sessions	128-bit / 256-bit AES CBC	OpenSSL – Derived as specified in TLS/HTTPS protocol
Bluetooth EPR/LE	DEK	Encryption/decryption of Bluetooth communications	128-bit AES	Generated within BT Chipset

- FCS\_CKM\_EXT.4: The TOE destroys cryptographic material (plaintext keys, authentication data, other security parameters) when they are no longer in use by the system. No plaintext cryptographic keying material resides in the TOE's flash, because the TOE encrypts all keys stored in flash. When performing a full wipe of protected data, the TOE cryptographically erases the protected data by clearing the DAR\_DEK that is used to encrypt the user data partition. Because the TOE's keystore stores encrypted keys within the user data partition, TOE effectively cryptographically erases those keys when clearing the Data-At-Rest DEK (DAR\_DEK). In turn, the TOE clears the DAR\_DEK and SD Card FEKs through a secure direct overwrite (BLKSECDISCARD ioctl) of the Flash memory containing the key followed by a read-verify. The TOE uses Flash memory with wear-leveling.
- FCS\_CKM\_EXT.5: The TOE stores all protected data in encrypted form within the user data partition. Upon request, the TOE cryptographically erases the DAR\_DEK that is protecting the user data partition, clears that key from memory, reformats the partition, and then reboots. The TOE's clearing of the DAR\_DEK follows the requirements of FCS\_CKM\_EXT.4.
- FCS\_CKM\_EXT.6: The TOE utilizes Salt values in the following locations:
  1. Salts used as part of derivation process of the DAR DEK key and SD Card key come from the Mocana crypto library CTR\_DRBG.
  2. TLS/HTTPS (c\_random, pre-master secret, ECDHE\_\*, DHE\_\*) come from the OpenSSL DRBG.
  3. WPA2 nonces come from the OpenSSL DRBG.

All of these values come from an RBG meeting FCS\_RBG\_EXT.1 as identified by Table 6-1.
- FCS\_COP.1(1): The TOE uses multiple cryptographic providers to perform encryption and decryption using AES in accordance with the standards, key sizes and modes referenced in Table 6-1 above.
- FCS\_COP.1(2): The TOE uses multiple cryptographic providers to perform cryptographic hashing using SHA algorithms in accordance with the standards and message digest sizes referenced in Table 6-1 above.
- FCS\_COP.1(3): The TOE uses multiple cryptographic providers to perform cryptographic signature generation and verification using either an ECDSA or RSA scheme that is in accordance with standards and key-sizes referenced in Table 6-1 above.
- FCS\_COP.1(4): The TOE uses multiple cryptographic providers to perform keyed-hash message authentication using the HMAC-SHA-1, HMAC-SHA-256, and HMAC-SHA-384 algorithms, meeting the standards referenced in the tables above. These include key sizes and message digest sizes of 160, 256 and 384.

- FCS\_COP.1(5): The TOE conditions a user's password per SP 800-132 using PBKDF2 using HMAC-SHA-1 with 10,000 iterations as part of SD card protection. The PBKDF2 operations combines a 128-bit salt with the user's password to obtain a 384-bit intermediate value that is encrypted by a KEK chaining to the REK to produce a 256-bit FEKEKEK and a 128-bit initialization vector.

For DAR protection, the TOE conditions a user's password per SP 800-132 using PBKDF2 using HMAC-SHA-256 with 10,000 iterations to obtain a 384-bit intermediate value. The resulting intermediate value is then encrypted using a KEK chaining to the REK to produce an intermediate KEK which encrypts the DAR\_DEK.

The TOE utilizes several mechanism to increase the computational complexity of the protections afforded by keys derived from passwords. First, the TOE performs 10,000 HMAC-SHA-256 or HMAC-SHA-1 iterations during PBKDF2 key derivation. The TOE also combines the password derived key with a KEK chained to the REK. Finally, the TOE enforces a maximum number of incorrect login attempts prior to wiping all user data.

The time needed to derive keying material does not impact or lessen the difficulty faced by an attacker's exhaustive guessing matter as the combination of the password derived KEK with REK value entirely prevents offline attacks. The TOE's maximum incorrect login attempts (less than 9), password length (between 4 and 16 characters) and password complexity rules prevent exhaustive online attacks because the number of combinations of passwords that an adversary can attempt is much higher than the maximum incorrect login attempts required before a device wipe is triggered.

- FCS\_HTTPS\_EXT.1: The TOE supports the HTTPS protocol compliant with RFC 2818. Applications on the TOE can act as an HTTPS client to connect to external servers using HTTPS over TLS (which is compliant with FCS\_TLSC\_EXT.2). The TOE also offers TLS APIs that ensure the certificate checking performed by the TOE as part of an HTTPS client's communications will satisfy FIA\_X509\_EXT not establish the connection to the targeted server.
- FCS\_IV\_EXT.1: The TOE generates IVs for data storage encryption and for key storage encryption. The TOE uses AES-CBC mode for data encryption.
- FCS\_RBG\_EXT.1: The TOE provides a number of different DRBGs as listed in Table 6-1 Cryptographic Algorithms, Providers and CAVP Certificates:
  - An SP800-90A AES-256 CTR DRBG provided by FIPS OpenSSL library.
  - An SP800-90A AES-256 CTR DRBG provided by the Mocana Crypto Library.

The TOE initializes each RBG with sufficient entropy ultimately accumulated from a TOE-hardware-based noise source (detailed information was provided to NIAP). The hardware based DRBG is seeded from the conditioned, hardware noise source. The hardware-based DRBG is fed into the Linux kernel's entropy pool which is reflected through /dev/random. The FIPS OpenSSL library and Mocana Crypto Library each include their own DRBG. The FIPS OpenSSL library is seeded from /dev/random. The Mocana Crypto Library is seeded from an XOR of the output of a proprietary software entropy algorithm with bits from /dev/random.

These sources for RBG all provide a security strength of at least 256-bits.

- FCS\_SRV\_EXT.1. The TOE provides applications access to the cryptographic operations including encryption (AES-CBC), hashing (SHA), signing and verification (RSA), key hashing (HMAC), password-based key-derivation functions (PKBDFv2 HMAC-SHA-256), generation of asymmetric keys for key establishment (RSA, DH, and ECDH), and generation of asymmetric keys for signature generation and verification (RSA). The TOE provides access through the Android operating system's Java API, through the native OpenSSL API, and through the kernel.
- FCS\_STG\_EXT.1: The TOE provides a hardware isolated protected keystore to the user and mobile applications. This keystore can generate, import and securely store symmetric and asymmetric keys. Keys can also be destroyed. While normally mobile applications cannot use or destroy the keys of another application, applications that share a common application developer (and are thus signed by the same

developer key) may do so. In other words applications with a common developer may use and destroy each other's keys located within the Secure Key Storage.

The TOE utilizes a TrustZone implementation of KeyMaster<sup>5</sup> key storage service to provide hardware-isolated secure key storage, for symmetric keys and asymmetric private keys.

- FCS\_STG\_EXT.2: The REK derived keys used for DAR protection, SD card protection, and the keystore are never stored in non-volatile memory.

The TOE protects all DEKs and KEKs associated with DAR and SD card protections provided by the REK and the user's password. These keys are encrypted by a KEK chaining to a REK and the password-derived KEK. The DAR\_DEK, FEKEK, and FEK are each encrypted using AES-256-GCM.

The Keymaster\_RDK is used to provide an integrity hash of asymmetric private keys and symmetric keys belonging to the user through the use of HMAC-SHA-256. These keys are protected by encrypting them with the SHK using AES-256-CBC.

Wi-fi keys are protected through the use of 802.11-2012 Key Confirmation Key (KCK) and Key Encryption Key (KEK) keys. These keys unwrap the WPA2 GTK (Group Temporal Key) send by an access point. Persistent wi-fi keys such as pre-shared keys or certificates are protected by storing them on an encrypted user data partition which is protected by a KEK chained to both a user's password and the device REK.

- FCS\_STG\_EXT.3: The GCM mode for AES encryption of the DAR\_DEK, and FEKEK provides integrity for stored DEKs and KEKs described for FCS\_STG\_EXT.2 immediately above. The integrity of the FEK is provided by a SHA-256 hash, encrypted by the FEKEK and stored with the encrypted FEK on the SD card. Stored asymmetric private keys and symmetric keys have integrity protections through the use of HMAC-SHA-256 (using the KeyMaster RDK).
- FCS\_TLSC\_EXT.1: The TSF supports TLSv1.0 and TLSv1.1 using the following pre-configured ciphersuites. These are used with EAP-TLS as part of WPA2.
  - TLS\_RSA\_WITH\_AES\_128\_CBC\_SHA
  - TLS\_RSA\_WITH\_AES\_256\_CBC\_SHA
  - TLS\_DHE\_RSA\_WITH\_AES\_128\_CBC\_SHA
  - TLS\_DHE\_RSA\_WITH\_AES\_256\_CBC\_SHA

The TOE supports mutual authentication by providing a certificate in response to a server's certificate request message received during TLS negotiation. The TOE verifies X.509v3 certificates as per FIA\_X509\_EXT.1, FIA\_X509\_EXT.2 and FIA\_X509\_EXT.3. When a certificate presented by a server during TLS negotiation is deemed invalid, the TOE rejects the TLS channel negotiation (i.e., no connection is established).

- FCS\_TLSC\_EXT.2: The TOE provides mobile applications (through its Android API) the use of TLS versions 1.2 including support for the following pre-configured cipher suites.
  - TLS\_RSA\_WITH\_AES\_128\_CBC\_SHA
  - TLS\_RSA\_WITH\_AES\_256\_CBC\_SHA
  - TLS\_DHE\_RSA\_WITH\_AES\_128\_CBC\_SHA
  - TLS\_DHE\_RSA\_WITH\_AES\_256\_CBC\_SHA
  - TLS\_ECDHE\_RSA\_WITH\_AES\_128\_CBC\_SHA
  - TLS\_ECDHE\_RSA\_WITH\_AES\_256\_CBC\_SHA
  - TLS\_ECDHE\_ECDSA\_WITH\_AES\_128\_CBC\_SHA
  - TLS\_ECDHE\_ECDSA\_WITH\_AES\_256\_CBC\_SHA
  - TLS\_RSA\_WITH\_AES\_128\_CBC\_SHA256
  - TLS\_RSA\_WITH\_AES\_256\_CBC\_SHA256

---

<sup>5</sup> See <https://source.android.com/security/keystore/> for more information about KeyMaster key storage.

- TLS\_DHE\_RSA\_WITH\_AES\_128\_CBC\_SHA256
- TLS\_DHE\_RSA\_WITH\_AES\_256\_CBC\_SHA256
- TLS\_ECDHE\_ECDSA\_WITH\_AES\_128\_CBC\_SHA256
- TLS\_ECDHE\_ECDSA\_WITH\_AES\_256\_CBC\_SHA384
- TLS\_ECDHE\_ECDSA\_WITH\_AES\_128\_GCM\_SHA256
- TLS\_ECDHE\_ECDSA\_WITH\_AES\_256\_GCM\_SHA384

The TOE supports mutual authentication by providing a X.509v3 certificate in response to a server's certificate request message received during TLS negotiation. The TOE verifies X.509v3 certificates as per FIA\_X509\_EXT.1, FIA\_X509\_EXT.2 and FIA\_X509\_EXT.3. In addition to this verification, the TOE implements identity verification that is consistent with RFC 6125. This includes checks of the Subject Alternative Name fields, checks of the Common Name field, and check for acceptable use of wildcards in names. When a certificate presented by a server during TLS negotiation is deemed invalid, the TOE rejects the TLS channel negotiation (i.e., no connection is established). The TOE does not support certificate pinning. The TOE presents secp256r1, secp384r1, and secp521r1 in the Supported Elliptic Curves extension of a Client Hello message. The TOE also supports a Client Hello that uses the Signaling Cipher Suite Value TLS\_EMPTY\_RENEGOTIATION\_INFO\_SCSV,

## 6.2 User data protection

The User data protection function is designed to satisfy the following security functional requirements:

- FDP\_ACF\_EXT.1:

The TOE provides the following categories of system services to applications.

1. normal – A lower-risk permission that gives an application access to isolated application-level features, with minimal risk to other applications, the system, or the user. The system automatically grants this type of permission to a requesting application at installation, without asking for the user's explicit approval (though the user always has the option to review these permissions before installing).
2. dangerous – A higher-risk permission that would give a requesting application access to private user data or control over the device that can negatively impact the user. Because this type of permission introduces potential risk, the system may not automatically grant it to the requesting application. For example, any dangerous permissions requested by an application may be displayed to the user and require confirmation before proceeding, or some other approach may be taken to avoid the user automatically allowing the use of such facilities.
3. signature – A permission that the system is to grant only if the requesting application is signed with the same certificate as the application that declared the permission. If the certificates match, the system automatically grants the permission without notifying the user or asking for the user's explicit approval.
4. signatureOrSystem – A permission that the system is to grant only to packages in the Android system image *or* that are signed with the same certificates. Please avoid using this option, as the signature protection level should be sufficient for most needs and works regardless of exactly where applications are installed. This permission is used for certain special situations where multiple vendors have applications built in to a system image which need to share specific features explicitly because they are being built together.

An example of a normal permission is the ability to vibrate the device: `android.permission.VIBRATE`. This permission allows an application to make the device vibrate, and an application that does not declare this permission would have its vibration requests ignored.

An example of a dangerous privilege would be access to location services to determine the location of the mobile device: `android.permission.ACCESS_FINE_LOCATION`. The TOE controls access to Dangerous permissions during the installation of the application. The TOE prompts the user to review the application's requested permissions (by displaying a description of each permission group, into which individual permissions map, that an application requested access to). If the user approves, then the mobile

device continues with the installation of the application. Thereafter, the mobile device grants that application during execution access to the set of permissions declared in its Manifest file.

An example of a signature permission is the `android.permission.BIND_VPN_SERVICE`, that an application must declare in order to utilize the `VpnService` APIs of the device. Because the permission is a Signature permission, the mobile device only grants this permission to an application that requests this permission *and* that has been signed with the same developer key used to sign the application declaring the permission (in the case of the example, the Android Framework itself).

An example of a `systemOrSignature` permission is the `android.permission.LOCATION_HARDWARE`, which allows an application to use location features in hardware (such as the geofencing API). The device grants this permission to requesting applications that either have been signed with the same developer key used to sign the android application declaring the permissions or that reside in the “system” directory within Android, which for Android 4.4 and above, are applications residing in the `/system/priv-app/` directory on the read-only system partition). Put another way, the device grants `systemOrSignature` permissions by Signature or by virtue of the requesting application being part of the “system image.”

Additionally, Android includes the following flags that layer atop the base categories.

5. `privileged` – this permission can also be granted to any applications installed as privileged apps on the system image. Please avoid using this option, as the signature protection level should be sufficient for most needs and works regardless of exactly where applications are installed. This permission flag is used for certain special situations where multiple vendors have applications built in to a system image which need to share specific features explicitly because they are being built together.
  6. `system` – Old synonym for "privileged".
  7. `development` – this permission can also (optionally) be granted to development applications (e.g., to allow additional location reporting during beta testing).
  8. `appop` – this permission is closely associated with an app op for controlling access.
  9. `pre23` - this permission can be automatically granted to apps that target API levels below API level 23 (Marshmallow/6.0).
  10. `installer` - this permission can be automatically granted to system apps that install packages.
  11. `verifier`- this permission can be automatically granted to system apps that verify packages.
  12. `preinstalled` – this permission can be automatically granted any application pre-installed on the system image (not just privileged apps) (the TOE does not prompt the user to approve the permission).
- `FDP_DAR_EXT.1`: The TOE utilizes the Mocana software to provide AES-256-GCM mode encryption for all data stored on the TOE in the user data partition (which includes both user data and TSF data). The TOE also has TSF data relating to key storage for TSF keys not stored in the system’s Android Key Store. The TOE separately encrypts those TSF keys and data. Additionally, the TOE includes a read-only file system in which the TOE’s system executables, libraries, and their configuration data reside. For its Data-At-Rest encryption of the user data partition on the internal Flash (where the TOE stores all user data and all application data), the TOE uses the AES-256 bit DEK in GCM mode to encrypt the entire partition. The TOE also provides AES-GCM-256 mode encryption of protected data stored on the external SD Card. The TOE encrypts each individual file stored on the SD Card, generating a unique FEK for each file.
  - `FDP_IFC_EXT.1`: The TOE provides mobile applications with an API to ensure IP routes are configured to direct IP traffic through the VPN. The API ensures that all traffic is directed through a VPN when a VPN connection exists. The API configures kernel packet filtering rules to ensure the TOE transmits all outbound traffic through the VPN (and thus is encrypted before being transmitted) and the TOE accepts inbound traffic only if that traffic is part of the established VPN. All other traffic (i.e., traffic not part of the VPN) is discarded by the TOE.
  - `FDP_STG_EXT.1`: The TOE’s Trusted Anchor Database consists of the built-in certs and any additional user or admin/MDM loaded certificates. The built-in certs are (individually stored in device’s read-only system image in the `/system/etc/security/cacerts` directory, and the user can individually disable through Android’s user interface [`Settings->Security-> Trusted Credentials`]. Because the built-in CA certificates

reside on the read-only system partition, the TOE places a copy of any disabled built-in certificate into the /data/misc/user/X/cacerts-removed/ directory, where “X” represents the user’s number (which starts at 0). The TOE stores added CA certificates in the corresponding /data/misc/user/X/cacerts-added/ directory and also stores a copy of the CA certificate in the user’s Secure Key Storage (residing in the /data/misc/keystore/user\_X/ directory).

- FDP\_UPC\_EXT.1: The TOE provides APIs allowing non-TSF applications (mobile applications) the ability to establish a secure channel using TLS, HTTPS, Bluetooth DR/EDR and Bluetooth LE. Mobile applications can use the following Android APIs for TLS, HTTPS, and Bluetooth respectively:

javax.net.ssl.SSLContext:

<http://developer.android.com/reference/javax/net/ssl/SSLContext.html>

javax.net.ssl.HttpURLConnection:

<http://developer.android.com/reference/javax/net/ssl/HttpsURLConnection.html>

android.bluetooth:

<http://developer.android.com/reference/android/bluetooth/package-summary.html>

### 6.3 Identification and authentication

The Identification and authentication function is designed to satisfy the following security functional requirements:

- FIA\_AFL\_EXT.1: The TOE maintains, for each user, the number of failed logins since the last successful login, and upon reaching the maximum number of incorrect logins, the TOE performs a full wipe of all protected data (and in fact, wipes all user data). An administrator can adjust the number of failed logins from the default of ten failed logins to a value between one and one hundred using an MDM. Turning power to the device off, does not affect the count of failed logins maintained by the TOE, because this count is saved in non-volatile storage. The lock screen failure count is maintained through a successful DAR authentication.
- FIA\_BLT\_EXT.1: The TOE requires explicit user authorization before it will pair with a remote Bluetooth device. The user can make the TOE visible to other Bluetooth enabled devices and can attempt, via explicit user action, to pair with a visible device. Furthermore, the user must explicitly accept pairing attempts from other devices.
- FIA\_PAE\_EXT.1: The TOE can join WPA2-802.1X (802.11i) wireless networks requiring EAP-TLS authentication, acting as a client/supplicant (and in that role connect to the 802.11 access point and communicate with the 802.1X authentication server).
- FIA\_PMG\_EXT.1: The TOE allows password for accounts to be composed of upper or lower case letters, numbers, and special characters including !, @, #, \$, %, ^, &, \*, ( and ). The TOE defaults to requiring passwords to have a minimum of four characters but no more than sixteen. However, an MDM application can change these defaults.
- FIA\_TRT\_EXT.1: The TOE allows users to authenticate at the touchscreen or through external ports connecting either a USB keyboard or a Bluetooth keyboard paired in advance of the login attempt. If not using an external keyboard, a user must authenticate through the standard User Interface (using the TOE touchscreen). Regardless of whether the input is via an external input source or the touchscreen, the TOE limits the number of authentication attempts through the UI to no more than ten attempts within 30 seconds (irrespective of what keyboard the operator uses). Thus if the current [the nth] and prior nine authentication attempts have failed, and the n-9th attempt was less than 30 second ago, the TOE will prevent any further authentication attempts until 30 seconds has elapsed. Note as well that the TOE will wipe itself when it reaches the maximum number of unsuccessful authentication attempts (as described in FIA\_AFL\_EXT.1 above).
- FIA\_UAU.7: The TOE allows the user to enter the user's password from the lock screen or from the DAR lock screen. The TOE will, by default, display the most recently entered character of the password briefly

or until the user enters the next character in the password, at which point the TOE obscures the character by replacing the character with a dot symbol.

- FIA\_UAU\_EXT.1: The TOE requires that a user enter their password in order for the TOE to derive a master key that can be combined with a KEK chaining to the REK; thus allowing the TOE to decrypt the DEK that protects the data stored in the user data partition (including the long-term trusted channel key material which is stored in the user data partition).
- FIA\_UAU\_EXT.2: The TOE, when configured to require a user password, the TOE will allow a user to do the following things before successfully authenticating:
  - take screen shots (automatically named and stored internally by the TOE),
  - enter password to unlock
  - make an emergency call,
  - receive an emergency call,
  - take pictures (stored internally) – unless the camera was disabled
  - turn the TOE off,
  - restart the TOE,
  - enable ECO mode
  - enable or disable airplane mode,
  - turn on Do Not Disturb mode,
  - turn Wi-Fi and Bluetooth off and on,
  - see notifications
  - configure sound/vibrate/mute,
  - set the volume,
  - use the camera, and
  - use the voice recorder.

Beyond those actions, a user cannot perform any other actions other than observing notifications displayed on the lock screen until after successfully authenticating. The TOE allows a user to configure, on a per application basis, whether notifications will be displayed.

- FIA\_UAU\_EXT.3: The TOE requires the user to enter their password in order to unlock the TOE. Additionally the TOE requires the user to confirm their current password when accessing the “Settings->Screen Lock” menu in the TOE’s user interface. Only after entering their current user password can the user then elect to change their password.
- FIA\_X509\_EXT.1: The TOE checks the validity of all imported CA certificates by checking for the presence of the basicConstraints extension and that the CA flag is set to TRUE as the TOE imports the certificate (per RFC 5280). Additionally the TOE verifies the extendedKeyUsage Server Authentication purpose during WPA2/EAP-TLS negotiation. The TOE's certificate validation algorithm examines each certificate in the path (starting with the peer's certificate) and first checks for validity of that certificate (e.g., has the certificate expired or it not yet valid, whether the certificate contains the appropriate X.509 extensions [e.g., the CA flag in the basic constraints extension for a CA certificate, or that a server certificate contains the Server Authentication purpose in the ExtendedKeyUsagefield]), then verifies each certificate in the chain (applying the same rules as above, but also ensuring that the Issuer of each certificate matches the Subject in the next rung 'up' in the chain and that the chain ends in a self-signed certificate present in either the TOE's trusted anchor database or matches a specified Root CA), and finally the TOE performs revocation checking for all certificates in the chain using a Certificate Revocation List (per RFC 5759).
- FIA\_X509\_EXT.2: The TOE uses X.509v3 certificates as part of protocol processing for EAP-TLS, TLS and HTTPS. The TOE comes with a built-in set of trusted certificates (a Trust Anchor Database). Users cannot remove any of these built-in CA certificates, but can make any as ‘disabled’ (which prevents them from being used to validate another certificate). Users and administrators can also import new trusted CA certificates into the Trust Anchor Database.

If, during the process of certificate verification, the TOE cannot establish a connection with the server acting as the CRL Distribution Point (CDP), the TOE will deem the server's certificate as invalid and not establish a TLS connection with the server.

- FIA\_X509\_EXT.3: The TOE's Android operating system provides applications with several Java API Class of methods for validating certification paths (certificate chains) that establishing a trust chain from a certificate to a trust anchor.

## 6.4 Security management

The Security management function is designed to satisfy the following security functional requirements:

- FMT\_MOF\_EXT.1: The TOE provides the management functions described in Table 5-2 Security Management Functions. The table includes annotations describing the roles that have access to each service and how to access the service.
- FMT\_SMF\_EXT.1: The TOE provides all management functions indicated as mandatory ("M") or implemented ("I") by Table 5-2 Security Management Functions.
- FMT\_SMF\_EXT.2: The TOE when unenrolled from an MDM alerts the administrator of the unenrollment and performs a factory reset.

## 6.5 Protection of the TSF

The Protection of the TSF function is designed to satisfy the following security functional requirements:

- FPT\_AEX\_EXT.1: The Linux kernel of the TOE's Android operating system provides address space layout randomization utilizing the `get_random_int(void)` kernel random function to provide eight unpredictable bits to the base address of any user-space memory mapping. The random function, though not cryptographic, ensures that one cannot predict the value of the bits.
- FPT\_AEX\_EXT.2: The TOE's Android 6.0.1 operating system utilizes a 3.10.x Linux kernel, whose memory management unit (MMU) enforces read, write, and execute permissions on all pages of virtual memory. The Android operating system (as of Android 2.3) sets the ARM No eExecute (XN) bit on memory pages and the TOE's ARMv8 Application Processor's Memory Management Unit (MMU) circuitry enforces the XN bits. From Android's documentation (<https://source.android.com/devices/tech/security/index.html>), Android 2.3 forward supports "Hardware-based No eExecute (NX) to prevent code execution on the stack and heap".

Section G3.7 of the ARM Architecture Reference Manual ARMv8 contains additional details about the memory access controls: <https://people.mozilla.org/~sstangl/arm/AArch64-Reference-Manual.pdf>

- FPT\_AEX\_EXT.3: The TOE's Android operating system provides explicit mechanisms to prevent stack buffer overruns in addition to taking advantage of hardware-based No eExecute to prevent code execution on the stack and heap. Specifically, the vendor builds the TOE (Android and support libraries) using `-fstack-protector` GCC feature. This compile option enables stack overflow protection and Android takes advantage of ARM v8 eExecute-Never to make the stack and heap non-executable. The vendor applies these protections to all TSF executable binaries and libraries (refer to 7, TSF Inventory for a complete list).
- FPT\_AEX\_EXT.4: The TOE protects itself from modification by untrusted subjects using a variety of methods. The first protection employed by the mobile device is a Secure Boot process that uses cryptographic signatures to ensure the authenticity and integrity of the bootloader and kernels using data fused into the device processor. The TOE protects its Device Key (REK) by generating and securely storing the Device Key within hardware and making it accessible only to Android TrustZone software. The REK is used to protect all other keys in the key hierarchy. The TOE ensures that all TrustZone software is cryptographically signed and that the signature is verified when the TrustZone software is invoked.

Additionally, the TOE's Android operating system provides "sandboxing" that ensures that each third-party mobile application executes with the file permissions of a unique Linux User ID, in a different virtual

memory space. This ensures that applications cannot access each other's memory space or files and cannot access the memory space or files of other applications (notwithstanding access between applications with a common application developer).

- **FPT\_KST\_EXT.1:** The TOE does not store any plaintext key material in its internal Flash or on external SD cards. This ensures that irrespective of how the TOE powers down (e.g., a user commands the TOE to power down, the TOE reboots itself, or battery depletes or is removed), all keys in internal Flash or on an external SD Card are wrapped with a KEK. Refer to Section 6.1 for a description of the keys, the key hierarchy, and the key storage protections afforded to all keys. The TOE encrypts all keys stored in Flash, upon boot-up, the TOE must first decrypt any keys in order to utilize them.
- **FPT\_KST\_EXT.2:** The TOE itself (i.e., the mobile device) comprises a cryptographic module that utilizes cryptographic libraries including the Mocana Crypto Library, OpenSSL library and the following system-level executables that utilize KEKs: dm-crypt, eCryptfs, wpa\_supplicant, Gatekeeper<sup>6</sup> and KeyMaster. The TOE ensures that plaintext key material does not leave this cryptographic module by only allowing the system-level executables access to the plaintext KEK values that protect all other keys in the TOE. The TSF software (the system-level executables) protects the plaintext KEKs and any plaintext DEK values in memory both by not providing any access to these values and by clearing them when no longer needed (in compliance with FCS\_CKM\_EXT.4).
- **FPT\_KST\_EXT.3:** The TOE does not provide any way to export plaintext DEKs or KEKs (including all keys stored in the Secure Key Store) as the TOE chains or directly encrypts all KEKs to the REK.
- **FPT\_NOT\_EXT.1:** When TOE self-tests detect a failure of self-test or TSF verification tests, the TOE enters a non-operational mode. In this mode the TOE presents the page "Decryption unsuccessful" with a "Reset" button. Upon press of the Reset button the TOE will perform a factory reset of the device. Alternately, a power cycle of the device will attempt a restart to boot again. Upon boot (either following a power-cycle or a factory reset) the self-test and TSF verifications run again and can repeat the process if failures continue.
- **FPT\_STM.1:** The TOE requires time for use with certificate validation, wpa\_supplicant, and the key store. These TOE components obtain time from the TOE using system API calls [e.g., time() or gettimeofday()]. An application cannot modify the system time as mobile applications need the android "SET\_TIME"<sup>6</sup> permission to do so. Likewise, only a process with root privileges can directly modify the system time using system-level APIs. The TOE uses the Cellular Carrier time (obtained through the Carrier's network time server) as a trusted source; however, the user can also manually set the time through the TOE's user interface.
- **FPT\_TST\_EXT.1:** The TOE performs known answer power on self-tests (POST) on its cryptographic algorithms to ensure that they are functioning correctly. The kernel itself performs known answer tests on its cryptographic algorithms to ensure they are working correctly and the SecurityManager service invokes the self-tests of the OpenSSL and Mocana cryptographic library at start-up to ensure that those cryptographic algorithms are working correctly. Should any of the tests fail, the TOE will reboot to see if that will clear the error.

**Table 6-3 Power-up Cryptographic Algorithm Known Answer Tests**

Algorithm	Implemented in	Description
<b>AES encryption/decryption</b>	OpenSSL	Comparison of known answer to calculated valued
<b>ECDH key agreement</b>	OpenSSL	Comparison of known answer to calculated valued
<b>DRBG random bit generation</b>	OpenSSL	Comparison of known answer to calculated valued
<b>HMAC-SHA</b>	OpenSSL	Comparison of known answer to calculated valued
<b>SHA hashing</b>	OpenSSL	Comparison of known answer to calculated valued
<b>RSA</b>	OpenSSL	Comparison of known answer to calculated valued
<b>ECDSA</b>	OpenSSL	Comparison of known answer to calculated valued
<b>AES encryption/decryption</b>	Mocana crypto library	Comparison of known answer to calculated valued

<sup>6</sup> Gatekeeper is an Android subsystem that is part of the TOE. It runs in Trustzone and supports user authentication.

<b>HMAC-SHA</b>	Mocana crypto library	Comparison of known answer to calculated valued
<b>SHA hashing</b>	Mocana crypto library	Comparison of known answer to calculated valued
<b>DRBG random bit generation</b>	Mocana crypto library	Comparison of known answer to calculated valued

- **FPT\_TST\_EXT.2:** The TOE ensures a secure boot process by having the TOE hardware begin execution from a BootROM within the Qualcomm processor. The BootROM verifies the digital signature of the next stage bootloader software (using a public key whose hash resides in the processor’s internal fuses) before transferring control to the next stage bootloader. This next stage bootloader in turn, like each subsequent stage of the boot process, verifies the signature of the next stage software that it is loading, including Android’s bootloader (ABOOT). ABOOT contains a public key which it uses to verify the system/primary and recovery images (effectively the system and recovery kernels and their respective initial RAM disks). The system/primary image included an additional public key, used to verify the root hash used by dm-verity to ensure the cryptographic integrity of Android’s /system partition. The recovery image includes a public key (within a file contained within the initial RAM Disk) used by the recovery image to verify the signature/authenticity/integrity of system software updates.
- **FPT\_TUD\_EXT.1:** The TOE's user interface provides a method to query the current version of the TOE software/firmware (Android version, baseband version, kernel version, and build number) and hardware (model number). Additionally, the TOE provides users the ability to review the currently installed apps (including 3rd party built-in applications) and their version.
- **FPT\_TUD\_EXT.2:** The TOE supports two distinct methods for updating software. The standard Android approach is used for the Sprint variant of the TOE. The AT&T and Verizon variants of the TOE utilize a method referred to as the Open Mobile Alliance (OMA) Device Management (DM). These update methods update both the application processor and the baseband processor software at the same time.

The standard Android approach verifies all FOTA (Firmware Over-The-Air) updates to the TOE software (which includes baseband processor updates) using a 2048-bit RSA public key protected ultimately by the Root Public Key, a hardware protected key whose SHA-256 hash resides inside the application processor.

The OMA-DM method for FOTA updates is done by saving the 2048-bit RSA public key onto /persist/fota (in encrypted form). The public key (corresponding to the key used by Kyocera to sign updates) is encrypted by a 3072-bit RSA asymmetric key. The 3072-bit RSA key is generated by KeyMaster and protected by the KeyMaster RDK uniquely for each mobile device during manufacturing. All FOTA updates are verified using the saved public key prior to it being installed on the mobile device.

The OMA-DM method is also used for the TOE Verizon variant when applying updates obtained through a USB connection. An installation application called the Software Update Assistant (SUA) is used to load the update onto the phone, and the update is verified using the OMA-DM method. Kyocera has disabled a second USB update method known as Software Repair Assistant (SRA) in CC mode, because this update approach does not meet the requirements for the TOE to not calculate the signature for the update.

Regardless of the update approach, the Android OS on the TOE requires that all applications bear a valid signature before Android will install the application.

- **ALC\_TSU\_EXT.1:** Kyocera accepts bug reports (including reports for security vulnerabilities) through a Technical Support Contact form on the Kyoceramobile.com web site. Kyocera reviews all bug reports making product changes to resolve issues associated with Kyocera developed code. Kyocera makes updates and code patches to resolve issues as quickly as possible, and makes updates available to customers. The TOE checks for updates daily, performing updates as described above when new updates are available on the Kyocera update servers. Issues associated with Android and reported directly to Google are handled through the Google product support process. Android security updates are sent by Google to all of their partners. Kyocera receives these updates and incorporates them into their own android image which is then distributed as described above.

## 6.6 TOE access

The TOE access function is designed to satisfy the following security functional requirements:

- FTA\_SSL\_EXT.1: The TOE can transition into a locked state either as a result of exceeding the configured inactivity period, the user pressing the power button, or as a result of receiving a 'lock' command from an MDM server through an authenticated and protected channel. Upon entering a locked state the TOE obscures the previous content by displaying a lock screen. After being locked, the lock screen displays email notifications, text message notifications, call notifications, date, time, battery life, signal strength and carrier network. In order to act upon the notifications, the user must authenticate to the TOE.

Note that during power up, the TOE presents the user with an initial power-up Data-At-Rest lock screen, where the user can only make an emergency call or enter the user password in order to allow the TOE to decrypt the Data-At-Rest key (i.e., DAR\_DEK) so as to be able to access the data partition and unlock the screen. After successfully authenticating at the initial power-up Data-At-Rest login screen, the user can access the TOE and upon (re)locking the TOE, the TOE will present the user the normal lock screen (which displays and allows the actions described in FIA\_UAU\_EXT.2.1.

- FTA\_WSE\_EXT.1: The TOE allows an administrator to specify (through the use of an MDM) a list of wireless networks (SSIDs) to which the user may direct the TOE to connect to. When not enrolled with an MDM, the TOE allows the user to control to which wireless networks the TOE should connect, but does not provide an explicit list of such networks, rather the user may scan for available wireless network (or directly enter a specific wireless network), and then connect. Once a user has connected to a wireless network, the TOE will automatically reconnect to that network when in range and the user has enabled the TOE's WiFi radio.

## 6.7 Trusted path/channels

The Trusted path/channels function is designed to satisfy the following security functional requirements:

- FTP\_ITC\_EXT.1: The TOE provides secured (encrypted and mutually authenticated) communication channels between itself and other trusted IT products through the use of 802.11-2012, 802.1X, and EAP-TLS, TLS, and HTTPS. The TOE permits itself and applications to initiate communicate via the trusted channel, and the TOE initiates communicate via the trusted channel for connection to a wireless access point. The TOE provides access to TLS via published APIs which are accessible to any application that needs an encrypted end-to-end trusted channel.

## 7. TSF Inventory

Below is a list of user-mode TSF binaries and libraries. All are built with the -fstack-protector option set. For each binary/library, the name, path and security function is provided.

Name	Path	Security Function
dalvikvm	system/bin	Virtual Machine
dalvikvm32	system/bin	Virtual Machine
dalvikvm64	system/bin	Virtual Machine
keystore	system/bin	Keystore
time_daemon	system/bin	Time
vold	system/bin	DAR
wpa_supplicant	system/bin	WPA2
libcrypto.so	system/lib	Crypto
libjavacrypto.so	system/lib	Crypto JNI
libssl.so	system/lib	SSL/TLS
libcrypto.so	system/lib64	Crypto
libjavacrypto.so	system/lib64	Crypto JNI
libsoftkeymaster.so	system/lib64	Key Store
libssl.so	system/lib64	SSL/TLS
libkeystore_binder_fips.so	system/lib	Keystore
libkeystore_binder_fips.so	system/lib64	Keystore
libkeystore_binder.so	system/lib	Keystore
libkeystore_binder.so	system/lib64	Keystore
qseecomd	system/bin	Trustzone Daemon
time_daemon	system/bin	Time
libmss.so	system/lib64	Mocana Crypto
libfipscrypto.so	system/lib	OpenSSL Crypto
libfipscrypto.so	system/lib64	OpenSSL Crypto
libfipssl.so	system/lib	OpenSSL SSL/TLS
libfipssl.so	system/lib64	OpenSSL SSL/TLS
libssl.so	system/lib	BoringSSL SSL/TLS
libssl.so	system/lib64	BoringSSL SSL/TLS
libcrypto.so	system/lib	BoringSSL Crypto
libcrypto.so	system/lib64	BoringSSL Crypto
