## 1.3 TOE overview

### 1.3.1 Database Encryption overview

KSignSecureDB (hereinafter referred to as "TOE") performs the function of preventing the unauthorized disclosure of confidential information by encrypting the database (hereinafter referred to as "DB"). The encryption target of the TOE is the DB managed by the database management system (hereinafter referred to as "DBMS") in the operational environment of the organization, and the protection profile defines the user data as all data before/after encrypted and stored in the DB. Part or all of the user data can be the encryption target, depending on the organizational security policies that runs the TOE. The DBMS that controls the DB in the operational environment of the organization is different from the DBMS that is directly used by the TOE to control the TSF data (security policy, audit data, etc.).

### 1.3.2 TOE type and scope

The TOE is provided as software and shall provide the encryption/decryption function for the user data by each column. The TOE type defined in this PP can be grouped into the 'plug-in type' and 'API type', depending on the TOE operation type. The TOE can support both types. The TOE developed by the plug-in type can generally be composed of the agent and management server, whereas the TOE developed by the API type can be composed of the API module and management server.

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

### 1.3.3 TOE usage and major security features

The TOE is used to encrypt the user data according to the policy set by the authorized administrator to prevent the unauthorized disclosure of the confidential information. In order that the authorized administrator can operate the TOE securely in the operational environment of the organization, the TOE provides various security features such as the security audit function that records and manages major auditable events; cryptographic support function such as cryptographic key management to encrypt the user and the TSF data, and cryptographic operation; user data protection function that encrypts the user data and protects the residual information; identification and authentication function such as verifying the identity of the authorized administrator, authentication failure handling, and mutual authentication among the TOE components; security management function for security functions, role definition, and configuration; TSF protection functions including protecting the TSF data transmitted among the TOE components, protecting the TSF data stored in the storage that is controlled by the TSF, and TSF self-test; and TOE access function to manage the access session of the authorized administrator.

The key for data encryption (DEK, Data Encryption Key) used to encrypt user data is encrypted and protected by key encryption keys (KEK, Key Encryption Key)

The TOE consists of KSignSecureDB Server that performs the security management function of key management, access control policy management, cryptographic key management and administrator management; KSignSecureDB DBAgent as plug-in that installs a cryptographic module inside the user DB server and performs the encryption/decryption; KSignSecureDB APIAgent as API that interlinks with user applications and requests the encryption/decryption of the user data stored in the DB.

Security Function	Main Function
User data protection	<ul style="list-style-type: none"> <li>- The TOE provides the function of encrypting/decrypting the data stored in the DBMS under the protection by the unit of column by using KSignCrypto for Java V1.0.1.0, a validated cryptographic module, and generates different ciphertext values for the same plaintexts.</li> <li>- The TOE controls access to the DB to be protected in accordance with the following security policies established by the administrator. (key, encryption, decryption), System, User, IP, Time (period), Day, Date (period)</li> </ul>

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

Cryptographic support	<ul style="list-style-type: none"> <li>- The TOE offers the function of generation, update and destruction of cryptographic keys used for encryption and decryption through the validated cryptographic module.</li> <li>- The TOE performs cryptographic operations (data encryption and decryption) by using the generated cryptographic key.</li> </ul>
Security audit	<ul style="list-style-type: none"> <li>- Audit data are generated, including the date and time of the event, the type of the event, the identity of the subject that caused the event, task details and the outcome.</li> <li>- When the TOE generates audit data, it records the date and time of the event by receiving a reliable timestamp from the operating system where the Server has been installed.</li> <li>- The TOE provides the authorized administrator with the function to review the audit data.</li> <li>- The TOE sends a warning email to the authorized administrator in case a potential security is detected.</li> <li>- The TOE sends a warning email to the authorized administrator and performs the backup of the audit data in case of foreseen audit data loss. An audited event is ignored in case the audit trail is full.</li> </ul>
Identification and authentication	<ul style="list-style-type: none"> <li>- The TOE must perform the identification and authentication process based on the ID and password prior to any behavior of the administrator. The TOE enforces a designated combination rule when administrator ID and password are generated. All administrators can access the TOE through the management tools. If the authentication attempts are unsuccessful for a defined number of times, the TOE postpones the authentication of the administrator for a specified period of time.</li> </ul>

**[Table 1-1] Main security properties**

 <b>KSIGN</b> <i>e-Security Leader</i>	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

## 1.4 TOE operational environment

### 1.4.1 Non-TOE and TOE operational environment

The TOE operational environment can be classified into the plug-in type and the API type as follows:

[Figure 1-1] shows a typical operational environment of the plug-in type. The plug-in operational environment is composed of the Management Server and DB Agent. First, the Management Server manages the information on policies established by the authorized administrator and manages the keys and the audit records. It also encrypts the information on a distributed key and loads it on the shared memory. Second, the DB Agent is installed inside the Database Server where the DB under the protection is located, and encrypts the user data received from the Application Server before they are stored in the DB. In addition, it decrypts the encrypted user data to be transmitted from the Database Server to the Application Server.

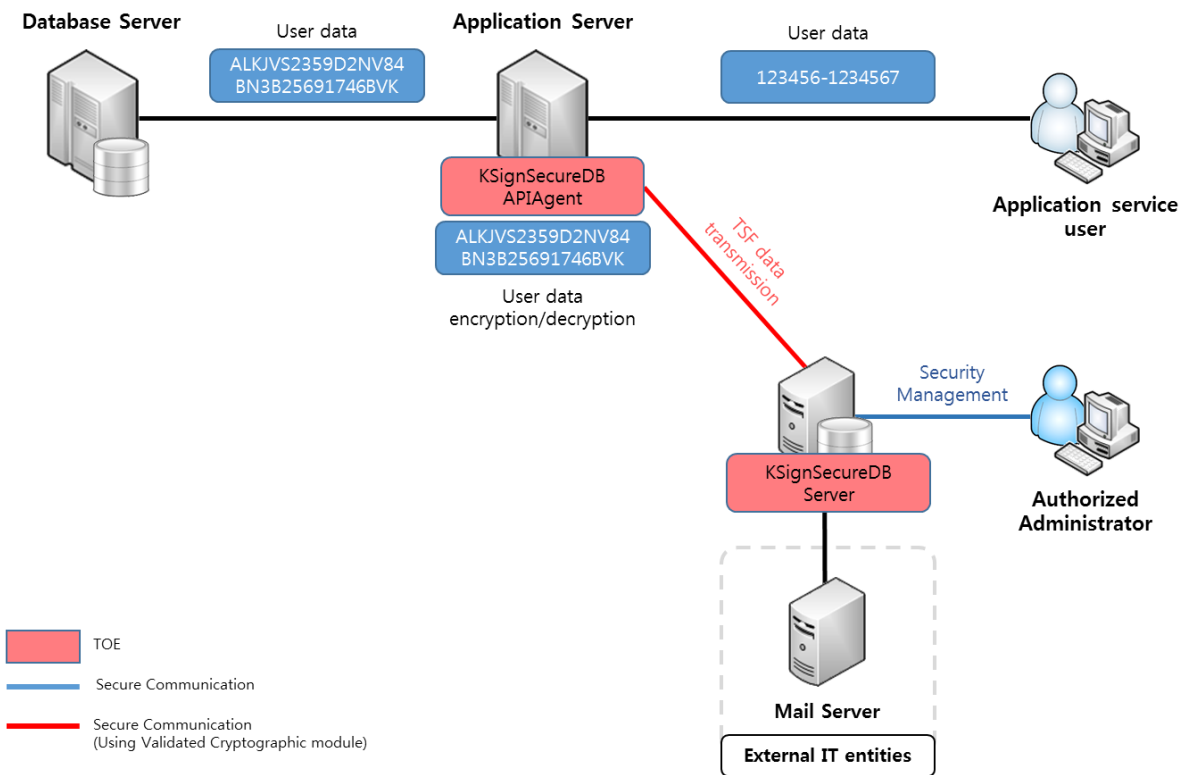

[Figure 1-1] Plug-in type operational environment (Agent, management server separate type)

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

The application service user requests the encryption or decryption of the user data through the Application Server in accordance with the scope of the encryption as required by the security policy. The requested data are encrypted by the DB Agent and stored in the DB. The authorized administrator accesses the Management Server to perform the security management of the encrypted data stored in the DB.

[Figure 1-2] shows the API type operational environment. The API type consists of the API Agent and the Management Server. The API Agent is installed and operated outside the DB under the protection, and performs the encryption and decryption of the important data in accordance with the policy established by the administrator. The authorized administrator can access the Management Server and perform the security management. The TOE components may be subject to change depending on the roles including the encryption and decryption of the important information, security management and cryptographic key management.

[Figure 1-2] API-type operational environment (API module, management server separate type)

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

The application service user performs the encryption and decryption of the user data through the API Agent on the Application Server in accordance with the scope of the encryption as required by the security policy. The authorized administrator accesses the Management Server to perform the security management of the encrypted data stored in the DB.

The cryptographic algorithm subject to the validation in the validated cryptographic module is used for the communication between the TOE components for the purpose of secure communication. In case the administrator accesses the Management Server through a web browser, a secure path (SSL/TLS V1.2) is generated to carry out the communication.

### 1.4.2 Requirements for non-TOE software, hardware, firmware

The TOE components consists of KSignSecureDB Server, KSignSecureDB DBAgent and KSignSecureDB APIAgent, which are distributed as software.

The minimum requirements and the operating system on which KSignSecureDB Server, KSignSecureDB DBAgent and KSignSecureDB APIAgent are installed and operated are as follows:

TOE	OS	Item	Specification
KSignSecureDB Server	AIX	OS	AIX 7.1 (64bit)
		CPU	PowerPC POWER5 2.1 GHz or higher
		Memory	8 GB or higher
		HDD	Space required for installation of TOE 3GB or higher
		NIC	100/1000 Mbps 1EA or higher
KSignSecureDB DBAgent KSignSecureDB APIAgent	AIX	OS	AIX 7.1 (64bit)
		CPU	PowerPC POWER5 2.1 GHz or higher
		Memory	4 GB or higher
		HDD	Space required for installation of TOE 1GB or higher
		NIC	100/1000 Mbps 1EA or higher

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

The operating system on which the TOE operates is as in the following.

Item		Specification
S/W	Web Browser	Google Chrome 86.0

The following describes the DBMS information protected by KSignSecureDB DBAgent used in the TOE

TOE	Protected subject DBMS
KSignSecureDB DBAgent For Oracle_AIX V3.6.1	Oracle 12cR2
KSignSecureDB DBAgent For Tiberio_AIX V3.6.1	Tiberio 6

The TOE uses the following validated cryptographic module.

TOE	S/W	Specification
KSignSecureDB Server	KSignCrypto for Java V1.0.1.0	Validated cryptographic module for key generation, destruction and update, and cryptographic operations. Validated cryptographic module for encrypted communication between TOE components.
KSignSecureDB DBAgent/ KSignSecureDB APIAgent	KSignCrypto for Java V1.0.1.0	Validated cryptographic module for key generation, destruction and update, and cryptographic operations. Validated cryptographic module for encrypted communication between TOE components.

The details of the validated cryptographic module included in the TOE are as following.

Item	Specification
Cryptographic module name	KSignCrypto for Java V1.0.1.0
Developer	KSign Co., Ltd.

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

Validation date	May 08, 2020
Validation level	VSL1
Validation number	CM-167-2025.5

Non-TOE software that is not within the TOE range but is required to operate normally is as following.

TOE	S/W	Specification
KSignSecureDB Server	Java(JRE) 1.8.0_261 (IBM-AIX pap6480sr6fp16-20200902_01)	Server start-up and operation, security management function and web server start-up based on Java Application
	Apache Tomcat 8.5.59	Encrypted communication between the web browser in the administrator system and the server Web server to provide the security management screen
	Oracle 12cR2	DBMS for the TOE management
KSignSecureDB DBAgent/ KSignSecureDB APIAgent	Java(JRE) 1.8.0_261 (IBM-AIX pap6480sr6fp16-20200902_01)	TOE DBAgent and APIAgent start-up and operation based on Java Application

Operating the TOE requires the following additional systems in the IT environment.

Item	Specification
Mail Server (SMTP Server)	Send alert mail to administrators

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

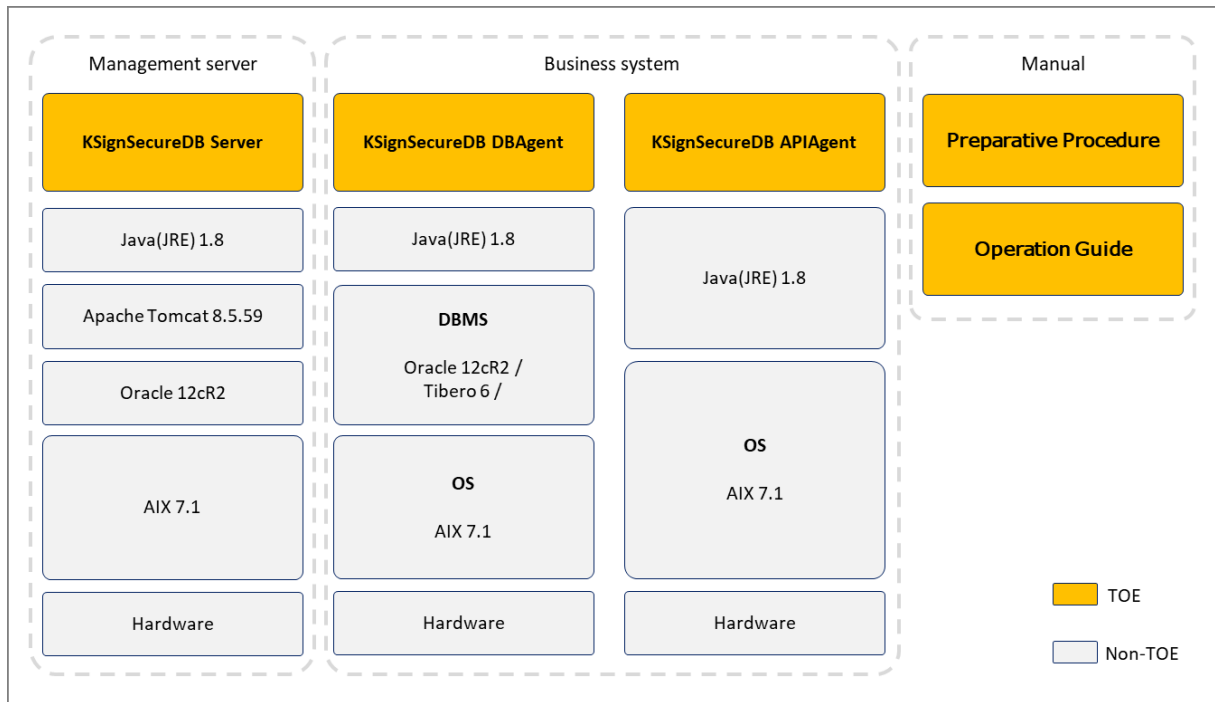

## 1.5 TOE description

This section describes the physical and logical scope and boundaries of the TOE.

### 1.5.1 Physical scope of the TOE

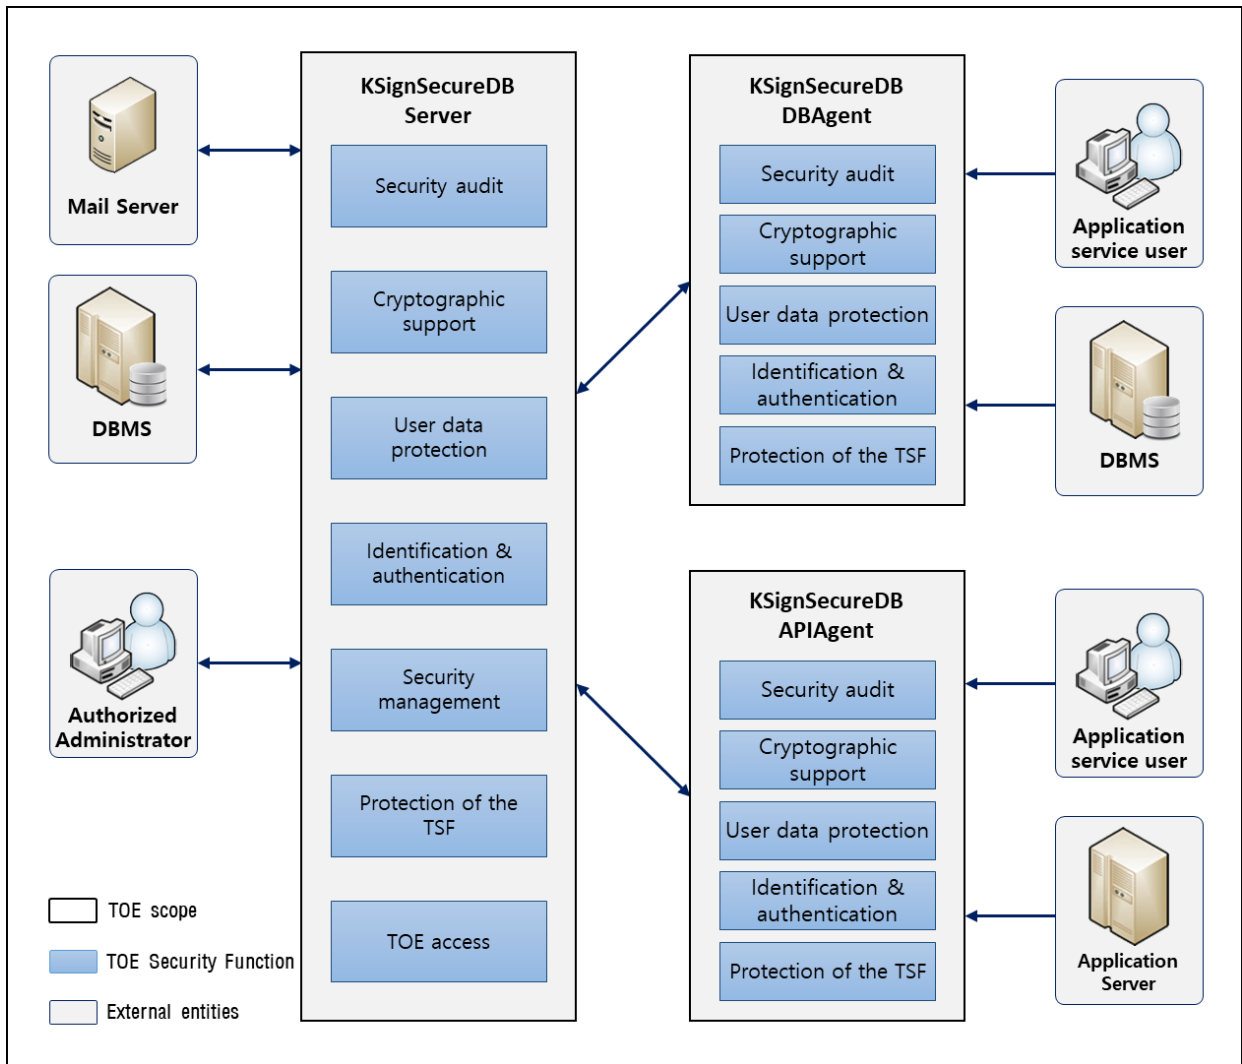

The TOE consists of Server, Agent, Preparation Procedures and Operation Guide.

Scope		Distribution Status	Type	Distribute
TOE components	KSignSecureDB Server	KSignSecureDB Server V3.6.1 (KSDBV36-Server_V3.6.1.tar)	S/W	CD
	KSignSecureDB DBAgent	KSignSecureDB DBAgent For Oracle_AIX V3.6.1 (KSDBV36-DBAgent_For_Oracle_AIX_V3.6.1.tar)		
		KSignSecureDB DBAgent For Tibero_AIX V3.6.1 (KSDBV36-DBAgent_For_Tibero_AIX_V3.6.1.tar)		
KSignSecureDB APIAgent	KSignSecureDB APIAgent For JAVA_AIX V3.6.1 (KSDBV36-APIAgent_For_API_JAVA_AIX_V3.6.1.tar)			
Manual	Preparative Procedure	KSignSecureDB V3.6 Preparative Procedure V1.6 (KSignSecureDB V3.6 Preparative Procedure V1.6.pdf)	File (PDF)	
	Operation Guide	KSignSecureDB V3.6 Operation Guide V1.5 (KSignSecureDB V3.6 Operation Guide V1.5.pdf)		

### 1.5.2 Logical scope of the TOE

The logical scope of the plug-in type and the API type according to the TOE operation method is as follows:

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

- Security audit

- The TOE provides a means that enables only the authorized administrator to view the audit information and provides the audit information in an understandable form. If an auditable event occurs, it generates the audit data, detects a potential violation and sends an alert email to the authorized administrator. Furthermore, it provides the function of storing all the generated audit data in the audit trail storage (DBMS) to manage them securely; preventing the audit data from unauthorized deletion; and protecting the audit trail storage by ignoring the audited event if the audit trail is full.

- Cryptographic support

- The TOE generates and destroys all cryptographic keys used for the operation of the product in a secure manner through the validated cryptographic module KSignCrypto for Java V1.0.1.0 whose safety and suitability for the implementation have been confirmed by the cryptographic module validation scheme, and performs cryptographic operations in accordance with the cryptographic policy that defines the cryptographic algorithm. Deletes original data when encryption is performed, and deletes encrypted data when decryption is performed. In addition, it generates and exchanges cryptographic keys through the validated cryptographic module KSignCrypto for Java V1.0.1.0 for secure communication between KSignSecureDB Server and KSignSecureDB DBAgent/ KSignSecureDB APIAgent that are physically separated.
- Cryptographic key generation:
  - HASH\_DRBG (SHA256, 256bit): Cryptographic key generation for the encryption/decryption of the TSF data, the encryption/decryption of the user data and the encryption/decryption of the cryptographic key (policy key)
  - RSAES (2048bit): Asymmetric key generation for the encryption/decryption of the master key and KSign-implemented SSL communication
  - HMAC(SHA256): Key generation for the protection of the TSF data
- Cryptographic key distribution
  - RSAES (2048bit): Encryption/decryption of the session key to transmit the data between the TOE components in case of the KSign-implemented Encryption communication

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

- Cryptographic operation
  - Encryption/decryption of symmetric key (SEED-CBC, 128bit): Encryption/decryption of main configuration information, the TSF data and the user data
  - Encryption/decryption of symmetric key (ARIA-CBC, 128bit / 192bit / 256bit): Encryption/decryption of the user data
  - One-way encryption (SHA256): Encryption of the user data, encryption of the TSF data and integrity verification
  - Encryption/decryption of asymmetric key (RSAES, 2048bit): Encryption/decryption of the master key
- Cryptographic key destruction
  - The cryptographic key information in the memory is deleted after the update with 0x00 if KSignSecureDB APIAgent and KSignSecureDB DBAgent are shut down.
  - The cryptographic key information is deleted by updating the temporarily stored cryptographic key information with 0x00 after sending the cryptographic key from KSignSecureDB Server to KSignSecureDB APIAgent and KSignSecureDB DBAgent.

■ User data protection

- The TOE provides the function of encrypting/decrypting the data stored in the DBMS under the protection by the unit of column by using KSignCrypto for Java V1.0.1.0, a validated cryptographic module, and generates different ciphertext values for the same plaintexts. In addition, it offers the function of blocking or allowing access to the DBMS under the protection in accordance with the security policy defined by the user.

■ Identification and authentication

- KSignSecureDB Server provides the function of performing the identification and authentication of the administrator who intends to use the security management function before the administrator initiates any behavior, and protecting authentication feedbacks when the authentication data are entered. Furthermore, it provides the secure identification and authentication function by locking the authentication in case of continuous failures in

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

authentication attempts. It also prevents the reuse of authentication information of the administrator who logs on to KSignSecureDB Server.

- The TOE provides mechanisms to verify that the user password verification meets the following defined metrics.
  - Password length: min. 10 digits, max. 30 digits
  - Allowable characters for password: English alphabets, numbers, special characters (!, @, #, \$, %, ^, \*)
  - A password must have a combination of three or more among uppercase or lowercase English alphabets, numbers and special characters.
- The TOE performs the mutual authentication through a KSign-implemented protocol between KSignSecureDB Server and KSignSecureDB DBAgent/KSignSecureDB APIAgent.

■ Security management

- KSignSecureDB Server provides the security management function including the management of access control policies, the administrator management and KSignSecureDB Server configuration for the authorized administrator. The authorized administrator carries out the management function through the security management interface.
- The authorized administrator includes top administrator, policy administrator, system administrator, encryption administrator and audit record review administrator. The administrator group is subject to multiple authentication by the TOE management function as follows.
  - Top administrator: The top administrator has the privilege of system management, establishing the table encryption and performing, encryption/decryption and audit record view, and can create lower-level administrators other than the top administrator. There are a limited number of IPs allowed for the administrator (two IPs) so that only the administrator authorized for access can be connected.
  - System administrator: The system administrator has the privilege of system management menu, generation, deletion and modification of the administrator and system configuration.
  - Policy administrator: The policy administrator establishes the policy for DBMS management and has the privilege of key (policy) registration.

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

- Encryption administrator: The encryption administrator has the privilege of establishing the table encryption and performing the encryption.
- Audit record review administrator: The audit record review administrator has the privilege of reviewing the audit records.
- It is enforced that the authorized administrator changes the password upon the initial access to the security management interface.

■ Protection of the TSF

- KSignSecureDB Server ensures the confidentiality and the integrity of the TSF data transmitted from/to KSignSecureDB DBAgent and KSignSecureDB APIAgent that are physically separated, through the encrypted communication. KSignSecureDB Server runs a suite of self tests to check the process status during the initial start-up and periodically during normal operation in order to demonstrate that it remains in the safe condition and its security functions are in normal operation. It also examines the integrity of the TSF data and TSF executable codes, which are subject to the integrity verification.
- The integrity items examined by KSignSecureDB Server are listed below:

Type	Name	Description
Config file	KSDB_Integrity_info.ini	A file containing the HASH value for the server module
	KSDB_PSVR.properties	Server configuration file
	KSDB_console.properties	Server configuration file
	KSDB_jdbc.properties	Server configuration file (Related DB connection)
	KSDB_workflow.properties	Server configuration file (Related to encryption / decryption scheduling)
Library file	KSDB_Workflow.jar	encryption / decryption scheduling library
	KSDB_PSVR_Common.jar	Core Library of Server
	KSignLicenseVerify-2.7.3.jar	License validation library
	KSDB_SSL.jar	KSign-implemented Encryption

 <b>KSIGN</b> <i>e-Security Leader</i>	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

		communication related library
	KSignCrypto_for_Java_v1.0.1.0.jar	Verified Cryptographic Module Interface Library

- Upon the start-up of KSignSecureDB DBAgent and KSignSecureDB APIAgent, the TSF data are loaded for the encrypted communication and mutual authentication. After the mutual authentication succeeds, the integrity information is sent to KSignSecureDB Server to verify the integrity against the integrity information (KSDB\_Integrity\_info.ini) registered inside the Server.
- The following is an integrity check files that the KSignSecureDB DBAgent checks.

Type	Name	Description
Config files	KSDB_JFT.prpperties	DBAgent encryption / decryption configuration file
	KSDB_KAGT.properties	DBAgent configuration file
Library files	KSDB_JFT.jar	DBAgent encryption / decryption library
	KSignLicenseVerify-2.7.3.jar	License validation library
	KSDB_KAGT.jar	DBAgent core library
	KSDB_SSL.jar	KSign-implemented Encryption communication related library
	libKSDB_SHM.a	Shared memory related library (Libraries vary by OS)
	KSignCrypto_for_Java_v1.0.1.0.jar	Verified Cryptographic Module Interface Library
	InitSecureDB.dat	TSF data encryption key file

The integrity items verified by KSignSecureDB APIAgent are listed below

Type	Name	Description
Config files	KSDB_JAP.properties	APIAgent encryption / decryption configuration file
	KSDB_KAGT.properties	APIAgent configuration file
Library files	KSignLicenseVerify-2.7.3.jar	License validation library
	KSDB_JAP.jar	APIAgent encryption / decryption library

KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
	Edit Date	2020-11-13	Version	V1.10
	No.	KSignSecureDB V3.6 Security Target V1.10		

	KSDB_KAGT.jar	APIAgent core library
	libKSDB_SHM.a	Shared memory related library (Libraries vary by OS)
	KSignCrypto_for_Java_v1.0.1.0.jar	Verified Cryptographic Module Interface Library
	InitSecureDB.dat	TSF data encryption key file

- The TOE manages the information on end user and administrator authentication, TOE integrity verification, KSignSecureDB Server and KSignSecureDB DBAgent/KSignSecureDB APIAgent and so forth by storing them in the DBMS in a secure manner in order to protect the TSF data.

■ TOE access

- In case of the management access sessions by the administrator allowed to access to perform the security management functions for KSignSecureDB Server, the maximum number of concurrent sessions is limited to one.
- If the top administrator is online, a lower-level administrator is not allowed to access. If the top administrator accesses while a lower-level administrator is online, the access by a lower-level administrator is cancelled. Furthermore, if an access attempt is made with the account which is the same as the top administrator account, the preceding access is cancelled. In case of login with the account or the privilege which is the same as that of a lower-level administrator, the preceding access is cancelled. In addition, the administrator session is terminated after a specified time interval of inactivity.

In this case, a lower-level administrator refers to the system administrator, the policy administrator, the encryption administrator and the audit record review administrator, except for the top administrator.

- In case of all administrators, access sessions are restricted in accordance with the accessible IP rules, and the management access sessions are allowed only on the terminals (two or less) that have IPs designated as accessible. Audit data are generated regarding the execution result of the limited number of sessions in the security management interface.

## 1.6 Terms and definitions

Terms used in this PP, which are the same as in the CC, must follow those in the CC.

### Session Key

Key generated from the validated cryptographic module and used during secure communication between KSignSecureDB Server and KSignSecureDB DBAgent or APIAgent

### Master Key

Key generated from the validated cryptographic module. It is generated on KSignSecureDB Server upon the initial start-up of the product. The generated Master Key is encrypted with the public key, and then stored in the DBMS so that it is managed securely.

### Policy key

Key generated from the validated cryptographic module. It is generated by the authorized administrator in the security management interface to be used for the encryption and decryption of the user data

### Object

Passive entity in the TOE containing or receiving information and on which subjects perform

### Attack potential

Measure of the effort to be expended in attacking a TOE expressed as an attacker's expertise, resources and motivation

### Iteration

Use of the same component to express two or more distinct requirements

 <b>KSIGN</b> <small>e-Security Leader</small>	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

### Security Target (ST)

Implementation-dependent statement of security needs for a specific identified TOE

### Protection Profile (PP)

Implementation-independent statement of security needs for a TOE type

### User

Refer to "External entity"

### Selection

Specification of one or more items from a list in a component

### Identity

Representation uniquely identifying entities (e.g. user, process or disk) within the context of the TOE

### Element

Indivisible statement of a security need

### Role

Predefined set of rules on permissible interactions between a user and the TOE

### Operation (On a component of the CC)

Modification or repetition of a component. Allowed operations on components are assignment, iteration, refinement and selection

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

**Operation (on a subject)**

Specific type of action performed by a subject on an object

**External Entity**

Human or IT entity possibly interacting with the TOE from outside of the TOE boundary

**Authorized Administrator**

Authorized user to securely operate and manage the TOE

**Authorized User**

The TOE user who may, in accordance with the SFRs, perform an operation

**Authentication Data**

Information used to verify the claimed identity of a user

**Assets**

Entities that the owner of the TOE presumably places value upon

**Refinement**

Addition of details to a component

**Organizational Security Policies**

Set of security rules, procedures, or guidelines for an organization wherein the set is currently given by actual or virtual organizations, or is going to be given

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

### Dependency

Relationship between components such that if a requirement based on the depending component is included in a PP, ST or package, a requirement based on the component that is depended upon must normally also be included in the PP, ST or package

### Subject

Active entity in the TOE that performs operations on objects

### Augmentation

Addition of one or more requirement(s) to a package

### Component

Smallest selectable set of elements on which requirements may be based

### Class

Set of CC families that share a common focus

### Target of Evaluation (TOE)

Set of software, firmware and/or hardware possibly accompanied by guidance

### Evaluation Assurance Level (EAL)

Set of assurance requirements drawn from CC Part 3, representing a point on the CC predefined assurance scale, that form an assurance package

### Family

Set of components that share a similar goal but differ in emphasis or rigour

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

### Assignment

The specification of an identified parameter in a component (of the CC) or requirement

### TOE Security Functionality (TSF)

Combined functionality of all hardware, software, and firmware of a TOE that must be relied upon for the correct enforcement of the SFRs

### TSF Data

Data for the operation of the TOE upon which the enforcement of the SFR relies

### Management access

The access to the TOE by using the HTTPS, SSH, TLS, etc to manage the TOE by administrator, remotely

### SSL (Secure Sockets Layer)

This is a security protocol proposed by Netscape to ensure confidentiality, integrity and security over a computer network

### TLS (Transport Layer Security)

This is a cryptographic protocol between a SSL-based server and a client and is described in RFC 2246

### Shall/must

The 'shall' or 'must' presented in Application notes indicates mandatory requirements applied to the TOE

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

### Can/could

The 'can' or 'could' presented in Application notes indicates optional requirements applied to the TOE by ST author's choice

### Recommend/be recommended

The 'recommend' or 'be recommended' presented in Application notes is not mandatorily recommended, but required to be applied for secure operations of the TOE

## 1.7 Conventions

The notation, formatting and conventions used in this PP are consistent with the Common Criteria for Information Technology Security Evaluation.

The CC allows several operations to be performed for functional requirements: iteration, assignment, selection and refinement. Each operation is used in this PP.

### Iteration

Iteration is used when a component is repeated with varying operations. The result of iteration is marked with an iteration number in parenthesis following the component identifier, i.e., denoted as (iteration No.).

### Iteration

Iteration is used when a component is repeated with varying operations. The result of iteration is marked with an iteration number in parenthesis following the component identifier, i.e., denoted as (iteration No.).

### Selection

This is used to select one or more options provided by the CC in stating a requirement. The result of selection is shown as underlined and italicized.

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

### Refinement

This is used to add details and thus further restrict a requirement. The result of refinement is shown in bold text.

### Security Target (ST) Author

This is used to represent the final decision of attributes being made by the ST author. The ST author's operation is denoted in braces, as in {decided by the ST author}. In addition, operations of SFR not completed in the Protection Profile must be completed by the ST author. "Application notes" is provided to clarify the intent of requirements, provide the information for the optional items in implementation, and define "Pass/Fail" criteria for a requirement. The application notes is provided with corresponding requirements if necessary.

### Application notes

This Security Target provides "Application Notes" to clarify the meaning of requirements and provides the information on options to be applied in the process of the implementation. It also defines the "pass/fail" criteria for the requirements. Application notes are provided together with relevant requirements if deemed necessary.

## 2. conformance claim

### 2.1 CC conformance claim

CC	Common Criteria for Information Technology Security Evaluation, Version 3.1, Revision 5	
	<ul style="list-style-type: none"> <li>■ Common Criteria for Information Technology Security Evaluation. Part 1: Introduction and General Model, Version 3.1, Revision 5 (CCMB-2017-04-001, April, 2017)</li> <li>■ Common Criteria for Information Technology Security Evaluation. Part 2: Security Functional Components, Version 3.1, Revision 5 (CCMB-2017-04-002, April, 2017)</li> <li>■ Common Criteria for Information Technology Security Evaluation. Part 3: Security Assurance Components, Version 3.1, Revision 5 (CCMB-2017-04-003, April, 2017)</li> </ul>	
PP	Korean National Protection Profile for Database Encryption V1.1	
Conformance claim	<b>2 Part 2 Security Functional components</b>	Extended: FCS_RBG.1, FIA_IMA.1, FDP_UDE.1, FMT_PWD.1, FPT_PST.1, FTA_SSL.5
	<b>Part 3 Security assurance components</b>	Conformant
	<b>Package</b>	Augmented: EAL1 augmented (ATE_FUN.1)

### 2.2 PP conformance claim

The Protection Profile to which this Security Target complies is 'Korean National Protection Profile for Database Encryption V1.1'

### 2.3 Package conformance claim

This Protection Profile claims conformance to assurance package EAL1 augmented with ATE\_FUN.1.

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

## 2.4 Conformance claim rationale

This ST adopts the TOE type, security objectives and security requirements in the same way as the Protection Profile, and it is demonstrated that this ST conforms to “the National PP for Database Encryption V1.1” “more restrictively and strictly” through the addition of OE.Time Stamp and OE.Audit Data Protection and SFR iteration.

SFRs to which an iteration operation is applied, among SFRs in the “National PP for Database Encryption V1.1”

: FCS\_CKM.1, FCS\_CKM, FCS\_COP.1

		No.	KSignSecureDB V3.6 Security Target V1.10		

### 3. Security objectives

The followings are the security objectives handled by technical and procedural method supported from operational environment in order to provide the TOE security functionality accurately.

#### 3.1 Security objectives for the operational environment

##### OE.PHYSICAL\_CONTROL

The place where the TOE components are installed and operated shall be equipped with access control and protection facilities so that only authorized administrator can access.

##### OE.TRUSTED\_ADMIN

The authorized administrator of the TOE shall be non-malicious users, have appropriately trained for the TOE management functions and accurately fulfill the duties in accordance with administrator guidances.

##### OE.SECURE\_DEVELOPMENT

The developer who uses the TOE to interoperate with the user identification and authentication function in the operational environment of the business system shall ensure that the security functions of the TOE are securely applied in accordance with the requirements of the manual provided with the TOE.

##### OE.LOG\_BACKUP

The authorized administrator of the TOE shall periodically checks a spare space of audit data storage in case of the audit data loss, and carries out the audit data backup (external log server or separate storage device, etc.) to prevent audit data loss.

##### OE.OPERATION\_SYSTEM\_RE-INFORCEMENT

The authorized administrator of the TOE shall ensure the reliability and security of the operating system by performing the reinforcement on the latest vulnerabilities of the operating system in which the TOE is installed and operated.

##### OE.TRUSTED\_TIMESTAMP

The TOE shall accurately record security-relevant events by using trusted time stamps provided by the TOE operational environment.

##### OE.SECURE\_DBMS

Audit records stored in the audit trail such as the DBMS that interlinks with the TOE shall be protected

## 4. Extended components definition

### 4.1 Cryptographic Support(FCS)

#### 4.1.1 Random Bit Generation

##### Family Behaviour

Family Behaviour

This family defines requirements for the TSF to provide the capability that generates random bits required for TOE cryptographic operation.

##### Component leveling

FCS\_RBG.1 random bit generation, requires TSF to provide the capability that generates random bits required for TOE cryptographic operation.

Management: FCS\_RBG.1

There are no management activities foreseen.

Audit: FCS\_RBG.1

There are no auditable events foreseen.

##### 4.1.1.1 FCS\_RBG.1 Random bit generation

Hierarchical to No other components.

Dependencies No dependencies.

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

FCS\_RBG.1.1 The TSF shall generate random bits required to generate an cryptographic key using the specified random bit generator that meets the following [assignment: list of standards].

## 4.2 Identification and authentication(FIA)

### 4.2.1 TOE Internal mutual authentication

#### Family Behaviour

This family defines requirements for providing mutual authentication between TOE components in the process of user identification and authentication.

#### Component leveling

FIA\_IMA.1 TOE Internal mutual authentication requires that the TSF provides mutual authentication function between TOE components in the process of user identification and authentication.

Management: FIA\_IMA.1

There are no management activities foreseen.

Audit: FIA\_IMA.1

The following actions are recommended to record if FAU\_GEN Security audit data generation family is included in the PP/ST:

- a) Minimal: Success and failure of mutual authentication

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

#### 4.2.1.1 FIA\_IMA.1 TOE Internal mutual authentication

Hierarchical to No other components.

Dependencies No dependencies.

FIA\_IMA.1.1 The TSF shall perform mutual authentication between [assignment: different parts of TOE] using the [assignment: authentication protocol] that meets the following [assignment: list of standards].

### 4.3 User data protection(FDP)

#### 4.3.1 User data encryption

##### Family Behaviour

This family provides requirements to ensure confidentiality of user data.

.

##### Component leveling

FDP\_UDE.1 User data encryption requires confidentiality of user data.

Management : FDP\_UDE.1

The following actions could be considered for the management functions in FMT:

a) Management of user data encryption/decryption rules

Audit : FDP\_UDE.1

The following actions are recommended to record if FAU\_GEN Security audit data generation is included in the PP/ST:

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

a) Minimal : Success and failure of user data encryption/decryption

#### 4.3.1.1 FDP\_UDE.1 User data encryption

Hierarchical to No other components.

Dependencies FCS\_COP.1 Cryptographic operation

FDP\_UDE.1.1 TSF shall provide TOE users with the ability to encrypt/decrypt user data according to [assignment: the list of encryption/decryption methods] specified.

### 4.4 Security Management(FMT)

#### 4.4.1 ID and password

##### Family Behaviour

This family defines the capability that is required to control ID and password management used in the TOE, and set or modify ID and/or password by authorized users.

##### Component leveling

FMT\_PWD.1 ID and password management, requires that the TSF provides the management function of ID and password.

Management: FMT\_PWD.1

The following actions could be considered for the management functions in FMT:

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

- a) Management of ID and password configuration rules.

Audit: FMT\_PWD.1

The following actions are recommended to record if FAU\_GEN Security audit data generation is included

in the PP/ST:

- a) Minimal: All changes of the password.

#### 4.4.1.1 FMT\_PWD.1 Management of ID and password

Hierarchical to 없음

Dependencies FMT\_SMF.1 Specification of management functions  
FMT\_SMR.1 Security roles

FMT\_PWD.1.1 The TSF shall restrict the ability to manage the password of [assignment: list of functions] to [assignment: the authorized identified roles].

1. [assignment: password combination rules and/or length]
2. [assignment: other management such as management of special characters unusable for password, etc.]

FMT\_PWD.1.2 The TSF shall restrict the ability to manage the ID of [assignment: list of functions] to [assignment: the authorized identified roles].

1. [assignment: ID combination rules and/or length]
2. [assignment: other management such as management of special characters unusable for ID, etc.]

FMT\_PWD.1.3 The TSF shall provide the capability for [selection, choose one of: setting ID and password when installing, setting password when installing, changing the ID and password when the authorized administrator accesses for the first time, changing the password when the authorized administrator accesses for the first time].

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

## 4.5 Protection of the TSF(FPT)

### 4.5.1 Protection of stored TSF data

#### Family Behaviour

This family defines rules to protect TSF data stored within containers controlled by the TSF from the unauthorized modification or disclosure.

#### Component leveling

FPT\_PST.1 Basic protection of stored TSF data, requires the protection of TSF data stored in containers controlled by the TSF.

Management: FPT\_PST.1

There are no management activities foreseen.

Audit: FPT\_PST.1

There are no auditable events foreseen.

#### 4.5.1.1 FPT\_PST.1 basic protection of stored TSF data

Hierarchical to No other components.

Dependencies No dependencies.

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

FPT\_PST.1.1 The TSF shall protect [assignment: TSF data] stored in containers controlled by the TSF from the unauthorized [selection: disclosure, modification].

## 4.6 TOE Access(FTA)

### 4.6.1 Session locking and termination

#### Family Behaviour

This family defines requirements for the TSF to provide the capability for TSF-initiated and user-initiated locking, unlocking, and termination of interactive sessions.

#### Component leveling

In CC Part 2, the session locking and termination family consists of four components. In this PP, it consists of five components by extending one additional component as follows. ※ The relevant description for four components contained in CC Part 2 is omitted. FTA\_SSL.5 The management of TSF-initiated sessions, provides requirements that the TSF locks or terminates the session after a specified time interval of user inactivity.

Management: FTA\_SSL.5

The following actions could be considered for the management functions in FMT:

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

- a) Specification for the time interval of user inactivity that is occurred the session locking and termination for each user
- b) Specification for the time interval of default user inactivity that is occurred the session locking and termination

Audit: FTA\_SSL.5

The following actions are recommended to record if FAU\_GEN Security audit data generation is included in the PP/ST:

- a) Minimal: Locking or termination of interactive session

#### 4.6.1.1 FTA\_SSL.5 Management of TSF-initiated sessions

Hierarchical to No other components.

Dependencies [FIA\_UAU.1 authentication or No dependencies.]

FTA\_SSL.5.1 The TSF shall [selection:

- lock the session and re-authenticate the user before unlocking the session,
- terminate] an interactive session after a [assignment: time interval of user inactivity].

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10

## 5. Security requirements

The security requirements specify security functional requirements and assurance requirements that must be satisfied by the TOE that claims conformance to this PP.

### 5.1 Security requirements

The security requirements specify security functional requirements and assurance requirements that must be satisfied by the TOE.

The security functional requirements included in this PP are derived from CC Part 2 and Chapter 4 Extended Components Definition.

The following table summarizes the security functional requirements used in the ST.

Security functional class	Security functional component	
Security audit (FAU)	FAU_ARP.1	Security alarms
	FAU_GEN.1	Audit data generation
	FAU_SAA.1	Potential violation analysis
	FAU_SAR.1	Audit review
	FAU_SAR.3	Selectable audit review
	FAU_STG.3	Action in case of possible audit data loss
	FAU_STG.4	Prevention of audit data loss
Cryptographic support (FCS)	FCS_CKM.1	Cryptographic key generation
	FCS_CKM.2	Cryptographic key distribution
	FCS_CKM.4	Cryptographic key destruction
	FCS_COP.1	Cryptographic operation

	FTA_MCS.2	Per user attribute limitation on multiple concurrent sessions
	FTA_SSL.5(Extended)	Management of TSF-initiated sessions
	FTA_TSE.1	TOE session establishment

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

[Table 5-1] Security functional requirements

## 5.1.1 Security audit(FAU)

### 5.1.1.1 FAU\_ARP.1 Security alarms

Hierarchical to No other components.

Dependencies FAU\_SAA.1 Potential violation analysis

FAU\_ARP.1.1 The TSF shall take [ Send e-mail to authorized administrator, Termination of violation process execution, Service disruption, Administrator account session termination or account lockout] upon detection of a potential security violation.

### 5.1.1.2 FAU\_GEN.1 Audit data generation

Hierarchical to No other components.

Dependencies FPT\_STM.1 Reliable time stamps

FAU\_GEN.1.1 The TSF shall be able to generate an audit record of the following auditable events:

- a) Start-up and shutdown of the audit functions;
- b) All auditable events for the not specified level of audit; and
- c) [Refer to the "auditable events" in [Table 5-2] Audit events, [none].

FAU\_GEN.1.2 The TSF shall record within each audit record at least the following information:

- a) Date and time of the event, type of event, subject identity (if applicable), and the outcome (success or failure) of the event; and

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

b) For each audit event type, based on the auditable event definitions of the functional components included in the PP/ST [ Refer to the contents of "additional audit record" in [Table 5-2] Audit events, none].

Security functional component	Auditable event	Additional audit record
FAU_ARP.1	Actions taken due to potential security violations	
FAU_SAA.1	Enabling and disabling of any of the analysis mechanisms, Automated responses performed by the tool	
FAU_STG.3	Actions taken due to exceeding of a threshold	
FAU_STG.4	Actions taken due to the audit storage failure	
FCS_CKM.1	Success and failure of the activity	
FCS_CKM.2	Success and failure of the activity (only applying to distribution of key related to user data encryption/decryption)	
FCS_CKM.4	Success and failure of the activity (only applying to destruction of key related to user data encryption/decryption)	
FCS_COP.1	Success and failure of the activity	
FDP_UDE.1	Success and failure of user data encryption/decryption	
FIA_AFL.1	The reaching of the threshold for the unsuccessful authentication attempts and the actions taken, and the subsequent, if appropriate, restoration to the normal state	
FIA_IMA.1	Success and failure of mutual authentication Modify of authentication protocol	
FIA_UAU.2	All use of the authentication mechanism	
FIA_UAU.4	Attempts to reuse authentication data	

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

FIA_UID.2	All use of the administrator identification mechanism, including the administrator identity provided	
FMT_MOF.1	All modifications in the behaviour of the functions in the TSF	
FMT_MTD.1	All modifications to the values of TSF data	Modified values of TSF data
FMT_PWD.1	All changes of the password	
FMT_SMF.1	Use of the management functions	
FMT_SMR.1	Modifications to the user group of rules divided	
FPT_TST.1	Execution of the TSF self tests and the results of the tests	Modified TSF data or execution code in case of integrity violation
FTA_MCS.2	Denial of a new session based on the limitation of multiple concurrent sessions	
FTA_SSL.5	Locking or termination of interactive session	

[Table 5-2] Audit event

### 5.1.1.3 FAU\_SAA.1 Potential violation analysis

Hierarchical to No other components.

Dependencies FAU\_GEN.1 Audit data generation

FAU\_SAA.1.1 The TSF shall be able to apply a set of rules in monitoring the audited events and based upon these rules indicate a potential violation of the enforcement of the SFRs.

FAU\_SAA.1.2 The TSF shall enforce the following rules for monitoring audited events:

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

a) Accumulation or combination of [authentication failure audit event among auditable events of FIA\_UAU.1, integrity violation audit event and selftest failure event of validated cryptographic module among auditable events of FPT\_TST.1

[Audit Trail Storage Exceeded Threshold and Saturation Event,  
License verification failure event]

] known to indicate a potential security violation

a) [No other components.]

#### 5.1.1.4 FAU\_SAR.1 Audit review

Hierarchical to No other components.

Dependencies FAU\_GEN.1 Audit data generation

FAU\_SAR.1.1 The TSF shall provide [authorized administrator] with the capability to read [all the audit data] from the audit records.

FAU\_SAR.1.2 The TSF shall provide the audit records in a manner suitable for the authorized administrator to interpret the information.

#### 5.1.1.5 FAU\_SAR.3 Selectable audit review

Hierarchical to No other components.

Dependencies FAU\_SAR.1 Audit review

FAU\_SAR.3.1 The TSF shall provide the capability to apply [View Period, Job Target (Agent, Table Owner), Job classification, Job Manager, Job Result and IP in descending order ] of audit data based on [Sort by date and time in descending order]

#### 5.1.1.6 FAU\_STG.3 Action in case of possible audit data loss

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

Hierarchical to No other components.

Dependencies FAU\_STG.1 Protected audit trail storage

FAU\_STG.3.1 The TSF shall [Notification to the authorized administrator, [None] if the audit trail exceeds [Threshold Exceeded Default Tablespace Size 80%].

### 5.1.1.7 FAU\_STG.4 Prevention of audit data loss

Hierarchical to FAU\_STG.3 Action in case of possible audit data loss

Dependencies FAU\_STG.1 Protected audit trail storage

FAU\_STG.4.1 The TSF shall [ignore audited events] and [Send warning e-mail to authorized administrator] if the audit trail is full.

## 5.1.2 Cryptographic support(FCS)

### 5.1.2.1 FCS\_CKM.1(1) Cryptographic key generation (User data encryption)

Hierarchical to No other components.

Dependencies [FCS\_CKM.2 Cryptographic key distribution, or  
FCS\_COP.1 Cryptographic operation]  
FCS\_CKM.4 Cryptographic key destruction  
FCS\_RBG.1 Random bit generation

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

FCS\_CKM.1.1 The TSF shall generate cryptographic keys in accordance with a specified cryptographic key generation algorithm [Table 5-3] cryptographic key generation algorithm] and specified cryptographic key sizes [cryptographic key sizes] that meet the following: [list of standards].

list of standard	Cryptographic operation	Cryptographic algorithm	Cryptographic key sizes	purpose
KS X 1213	Symmetric key encryption	ARIA (CBC)	128	User data encryption / decryption
			192	
			256	
TTAS.KO-12.0004	Symmetric key encryption	SEED (CBC)	128	User data encryption / decryption
ISO/IEC 10118-3	One-way encryption	SHA256	N/A	User data encryption
		SHA512	N/A	
NIST SP 800-90	Random bit generation	HASH-DRBG- SHA256	N/A	encryption key generation

[Table 5-3] User data encryption algorithm and key length

### 5.1.2.2 FCS\_CKM.1(2) Cryptographic key generation (TSF data encryption)

Hierarchical to No other components.

Dependencies [FCS\_CKM.2 Cryptographic key distribution, or  
FCS\_COP.1 Cryptographic operation]  
FCS\_CKM.4 Cryptographic key destruction  
FCS\_RBG.1 Random bit generation

FCS\_CKM.1.1 The TSF shall generate cryptographic keys in accordance with a specified cryptographic key generation algorithm which [[Table 5-4] TSF data encryption algorithm and key length] and specified cryptographic key sizes that meet the following: [list of standards].

list of standard	Cryptographic operation	Cryptographic algorithm	Cryptographic key sizes	Toe Module	Cryptographic key creation
TTAS.KO-12.0004	Symmetric key encryption	SEED (CBC)	128	KSignSecureDB Server	Encryption for user data encryption key protection (policy key encryption) - master key
TTAS.KO-12.0004	Symmetric key encryption	SEED (CBC)	128	KSignSecureDB Server, KSignSecureDB DBAgent, KSignSecureDB APIAgent	TSF data encryption (used for data encryption transfer between TOE components) - Session key
TTAS.KO-12.0004	Symmetric key encryption	SEED (CBC)	128	KSignSecureDB Server	TSF data encryption (encryption of important information stored in policy DB) - DEK
TTAS.KO-12.0004	Symmetric key encryption	SEED (CBC)	128	KSignSecureDB Server	Encryption for TSF data encryption key protection (TSF DEK encryption and decryption) - KEK
ISO/IEC 10118-3	Symmetric key encryption	SHA256	N/A	KSignSecureDB Server	Encrypt the administrator password
ISO/IEC 10118-3	Symmetric key encryption	SHA256	N/A	KSignSecureDB Server, KSignSecureDB DBAgent, KSignSecureDB	TOE component integrity verification Mutual authentication between TOE components Verify Cryptographic Key

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

				APIAgent	Integrity
Ks X ISO/IEC 97972	Generating an encryption key by deriving it from the password function	HMAC-SHA2	256	KSignSecureDB Server, KSignSecureDB DBAgent, KSignSecureDB APIAgent	For TSF data encryption key protection Cryptographic key generation (KEK generation)
ISO/IEC 18033-2	Public key encryption	RSAES	2048	KSignSecureDB Server, KSignSecureDB DBAgent, KSignSecureDB APIAgent	Encryption for master key protection
ISO/IEC 18033-2	Public key encryption	RSAES	2048	KSignSecureDB Server, KSignSecureDB DBAgent, KSignSecureDB APIAgent	Encryption for TSF data encryption key protection (TSF DEK encryption / decryption)
ISO/IEC 18033-2	Public key encryption	RSAES	2048	Communication between TOE components	TOE key exchange and session key encryption for data transmission between components
NIST SP 800-90	Random bit generation	HASH-DRBG-SHA256	256	KSignSecureDB Server, KSignSecureDB DBAgent, KSignSecureDB APIAgent	Use to generate cryptographic keys

[Table 5-4] TSF data encryption algorithm and key length

### 5.1.2.3 FCS\_CKM.2 Cryptographic key distribution

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

Hierarchical to No other components.

Dependencies [FDP\_ITC.1 Import of user data without security attributes, or  
FDP\_ITC.2 Import of user data with security attributes, or  
FCS\_CKM.1 Cryptographic key generation]  
FCS\_CKM.4 Cryptographic key destruction

FCS\_CKM.2.1 The TSF shall destruct cryptographic keys in accordance with a specified cryptographic key destruction method [[Table 5-5] cryptographic key destruction method] that meets the following: [list of standards].

list of standard	Distribution target	Distribution method
KS X ISO/IEC 11770-3:2008	User data encryption key of FCS_CKM.1 (1)	Communication intercal encryption using handshake encryption using validated cryptographic module
KS X ISO/IEC 11770-3:2008	Communication interval between TOE modules encryption Session Key from FCS_CKM.1(2)	Handshake Encryption Using validated Cryptographic Module

**[Table 5-5] cryptographic key destruction method**

#### 5.1.2.4 FCS\_CKM.4 Cryptographic key destruction

Hierarchical to No other components

Dependencies [FDP\_ITC.1 Import of user data without security attributes, or  
FDP\_ITC.2 Import of user data with security attributes, or  
FCS\_CKM.1 Cryptographic key generation]

FCS\_CKM.4.1 The TSF shall destruct cryptographic keys in accordance with a specified cryptographic key destruction method [[Table 5-6] Stored and used cryptographic key destruction] that meets the following: [list of standards].

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

Standard list	Cryptographic key storage location	Destruction method	Destruction object	Destruction point
N/A	DB	Overwrite everything with "0x00"	User date encryption key(policy key)	When the administrator deletes the security policy
N/A	Memory	Overwrite everything with "0x00"	Public key, policy key, TSF DEK	When calling process shutdown or logout function
N/A	Memory	Overwrite everything with "0x00"	Session key	At the end of communication
N/A	Memory	Overwrite everything with "0x00"	Policy key TSF DEK	Immediately after cryptographic operation

[Table 5-6] Stored and used cryptographic key destruction

### 5.1.2.5 FCS\_COP.1(1) Cryptographic operation (User data encryption) (SEED)

Hierarchical to No other components.

Dependencies [FDP\_ITC.1 Import of user data without security attributes, or FDP\_ITC.2 Import of user data with security attributes, or FCS\_CKM.1 Cryptographic key generation] FCS\_CKM.4 Cryptographic key destruction

FCS\_COP.1.1 The TSF shall perform [User data encryption and decryption] in accordance with a specified cryptographic algorithm and cryptographic key sizes that meet the following: [[Table 5-3] User data encryption algorithm and key length].

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

### 5.1.2.6 FCS\_COP.1(2) Cryptographic operation (TSF data encryption) (ARIA)

Hierarchical to No other components.

Dependencies [FDP\_ITC.1 Import of user data without security attributes, or  
FDP\_ITC.2 Import of user data with security attributes, or  
FCS\_CKM.1 Cryptographic key generation]  
FCS\_CKM.4 Cryptographic key destruction

FCS\_COP.1.1 The TSF shall perform [User data encryption and decryption] in accordance with a specified cryptographic algorithm and cryptographic key sizes that meet the following: [[Table 5-4] TSF data encryption algorithm and key length].

### 5.1.2.7 FCS\_COP.1(3) Cryptographic operation (TSF data encryption) (SHA256)

Hierarchical to No other components.

Dependencies [FDP\_ITC.1 Import of user data without security attributes, or  
FDP\_ITC.2 Import of user data with security attributes, or  
FCS\_CKM.1 Cryptographic key generation]  
FCS\_CKM.4 Cryptographic key destruction

FCS\_COP.1.1 The TSF shall perform [User data hash operation] in accordance with a specified cryptographic algorithm and cryptographic key sizes that meet the following: [[Table 5-4] TSF data encryption algorithm and key length].

### 5.1.2.8 FCS\_COP.1(4) Cryptographic operation (TSF data encryption) (RSAES)

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

Hierarchical to No other components.

Dependencies [FDP\_ITC.1 Import of user data without security attributes, or  
FDP\_ITC.2 Import of user data with security attributes, or  
FCS\_CKM.1 Cryptographic key generation]  
FCS\_CKM.4 Cryptographic key destruction

FCS\_COP.1.1 The TSF shall perform [TSF data encryption and decryption] in accordance with a specified cryptographic algorithm and cryptographic key sizes that meet the following: [[Table 5-4] TSF data encryption algorithm and key length].

#### 5.1.2.9 FCS\_COP.1(5) Cryptographic operation (TSF data encryption) (SEED)

Hierarchical to No other components.

Dependencies [FDP\_ITC.1 Import of user data without security attributes, or  
FDP\_ITC.2 Import of user data with security attributes, or  
FCS\_CKM.1 Cryptographic key generation]  
FCS\_CKM.4 Cryptographic key destruction

FCS\_COP.1.1 The TSF shall perform [TSF data encryption and decryption] in accordance with a specified cryptographic algorithm and cryptographic key sizes that meet the following: [[Table 5-4] TSF data encryption algorithm and key length].

#### 5.1.2.10 FCS\_COP.1(6) Cryptographic operation (TSF data encryption) (SHA2)

Hierarchical to No other components.

Dependencies [FDP\_ITC.1 Import of user data without security attributes, or

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

FDP\_ITC.2 Import of user data with security attributes, or

FCS\_CKM.1 Cryptographic key generation]

FCS\_CKM.4 Cryptographic key destruction

FCS\_COP.1.1 The TSF shall perform [User data hash operation] in accordance with a specified cryptographic algorithm and cryptographic key sizes that meet the following: [[Table 5-4] TSF data encryption algorithm and key length].

#### 5.1.2.11 FCS\_COP.1(7) Cryptographic operation (TSF data encryption) (HMAC\_SHA256)

Hierarchical to No other components.

Dependencies [FDP\_ITC.1 Import of user data without security attributes, or

FDP\_ITC.2 Import of user data with security attributes, or

FCS\_CKM.1 Cryptographic key generation]

FCS\_CKM.4 Cryptographic key destruction

FCS\_COP.1.1 The TSF shall perform [Generate random bits for password key derivation] in accordance with a specified cryptographic algorithm and cryptographic key sizes that meet the following: [[Table 5-4] TSF data encryption algorithm and key length].

#### 5.1.2.12 FCS\_RBG.1 Random bit generation (Extended)

Hierarchical to No other components.

Dependencies No dependencies.

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

FCS\_RBG.1.1 The TSF shall generate random bits required to generate an cryptographic key using the specified random bit generator that meets the following [[Table 5-7] random bit generator].

Standard list	Random bit generator	Base function
NIST SP 800-90	HASH-DRBG-SHA256	HASH function

[Table 5-7] random bit generator

### 5.1.3 User data protection(FDP)

#### 5.1.3.1 FDP\_UDE.1 User data encryption

Hierarchical to No other components.

Dependencies FCS\_COP.1 Cryptographic operation

FDP\_UDE.1.1 The TSF shall provide a function that can encrypt/decrypt the user data to the TOE user according to the specified [encryption/decryption method by column, [none]].

#### 5.1.3.2 FDP\_RIP.1 Subset residual information protection

Hierarchical to No other components.

Dependencies No dependencies.

FDP\_RIP.1.1 The TSF shall ensure that any previous information content of a resource is made unavailable upon the allocation of the resource to, deallocation of the resource from the following objects: [ user data ].

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

## 5.1.4 Identification and authentication (FIA)

### 5.1.4.1 FIA\_AFL.1 Authentication failure handling

Hierarchical to No other components.

Dependencies FIA\_UAU.1 Timing of authentication

FIA\_AFL.1.1 The TSF shall detect when, an administrator configurable positive integer within [5] unsuccessful authentication attempts occur related to [list of authentication events].

FIA\_AFL.1.2 When the defined number of unsuccessful authentication attempts has been met, the TSF shall [Send mail to administrator and lock the account].

### 5.1.4.2 FIA\_IMA.1 TOE Internal mutual authentication (Extended)

Hierarchical to No other components.

Dependencies No dependencies.

FIA\_IMA.1.1 The TSF shall perform mutual authentication using [Self-Implementation Authentication Protocol] in accordance with [none] between [Management Server - Agent].

### 5.1.4.3 FIA\_SOS.1 Verification of secrets

Hierarchical to No other components.

Dependencies No dependencies.

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

FIA\_SOS.1.1 The TSF shall provide a mechanism to verify that secrets meet [Acceptance criteria defined below].

- privacy information agreement
- Password length: From 10 up to 30 digits consisting of a combination of uppercase and lowercase English alphabets, numbers and special characters
- Uppercase English alphabets: A – Z (26)
- Lowercase English alphabets: a – z (26)
- Numbers: 0 – 9 (10)
- Special characters: !, @, #, \$, %, ^, \* (7)
- Verifying password rules : Combination of English characters (capital letter, small letter), numbers, and special characters use three or more combinations and lengths must be 10 to 30 digits

#### 5.1.4.4 FIA\_UAU.2 User authentication before any action

Hierarchical to :

FIA\_UAU.1 Timing of authentication

Dependencies :

FIA\_UID.1 Timing of identification

FIA\_UAU.2.1 The TSF shall require each user to be successfully authenticated before allowing any other TSF-mediated actions on behalf of that **authorized administrator**.

#### 5.1.4.5 FIA\_UAU.4 Single-use authentication mechanisms

Hierarchical to No other components.

Dependencies No dependencies.

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

FIA\_UAU.4.1 The TSF shall prevent reuse of authentication data related to [password authentication scheme].

#### 5.1.4.6 FIA\_UAU.7 Protected authentication feedback

Hierarchical to No other components.

Dependencies FIA\_UAU.1 Timing of authentication

FIA\_UAU.7.1 The TSF shall provide only [Password being entered are masked (password masking with ●) to prevent them from being disclosed on the screen., In case of failure of identification and authentication, feedbacks on the reason for the failure are not provided.] to the user while the authentication is in progress.

#### 5.1.4.7 FIA\_UID.2 User identification before any action

Hierarchical to FIA\_UID.1 User identification before any action

Dependencies No dependencies.

FIA\_UID.2.1 The TSF shall require each user to be successfully identified before allowing any other TSF-mediated actions on behalf of that authorized administrator.

### 5.1.5 Security management(FMT)

#### 5.1.5.1 FMT\_MOF.1 Management of security functions behaviour

 <b>KSIGN</b> <i>e-Security Leader</i>	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

Hierarchical to No other components.

Dependencies FMT\_SMF.1 Specification of Management Functions  
FMT\_SMR.1 Security roles

FMT\_MOF.1.1 The TSF shall restrict the ability to conduct management actions of the functions [[Table 5-6] security function lists] to [authorized administrator].

Security function component	Management function	Authorized Administrator
FAU_SAA.1	Maintenance of the rules (addition, removal and modification of the rules in the rule group)	Super Manager
FAU_SAR.1	Maintenance (deletion, modification, addition) of the group of users with read access right to the audit records	Super Manager, Audit Manager
FDP_UDE.1	Management of the user data encryption/decryption rules	Super Manager, Policy Manager, Cryptographic Manager
FIA_UAU.2	Management of the authentication data by an administrator	Super Manager, System Manager
FIA_UID.2	Management of the administrator and end-user identities	Super Manager, System Manager
FMT_MOF.1	Management of the group of roles that can interact with the functions in the TSF	Super Manager, System Manager
FMT_MTD.1	Management of the group of roles that can interact with the TSF data	Super Manager, System Manager
FMT_SMR.1	Management of the group of users that are part of a role.	Super Manager, System Manager
FPT_ITT.1	Management of the types of modification against which the TSF should protect Management of the mechanism used to provide the protection of the	Super Manager, Policy Manager

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

	data in transit between different parts of the TSF	
--	--	--

**[Table 5-6] security function lists**

### 5.1.5.2 FMT\_MTD.1 Management of TSF data

Hierarchical to No other components.

Dependencies FMT\_SMF.1 Specification of Management Functions  
FMT\_SMR.1 Security roles

FMT\_MTD.1.1 The TSF shall restrict the ability to manage [[Table 5 8] TSF data List] to [Authorized Administrator].

Security function component	Management function	Authorized Administrator
FAU_STG.3	Maintenance of the threshold	Super Manager, System Manager
FIA_AFL.1	Management of the threshold for unsuccessful authentication attempts	Super Manager, System Manager
FIA_UAU.2	Management of the authentication data by an administrator	Super Manager, System Manager
FIA_UID.2	Management of the administrator and end-user identities	Super Manager, System Manager
FPT_TST.1	Management of the conditions under which TSF self testing occurs, such as during initial start-up, regular interval, or under specified conditions Management of the time interval if appropriate	Super Manager
FTA_MCS.2	Management of the maximum allowed number of concurrent user sessions by an	Super Manager

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		
administrator					

[Table 5-8] TSF data List

### 5.1.5.3 FMT\_PWD.1 Management of ID and password(Extended)

Hierarchical to No other components.

Dependencies FMT\_SMF.1 Specification of Management Functions  
FMT\_SMR.1 Security roles

FMT\_PWD.1.1 The TSF shall restrict the ability to manage the password of [none] to [none].

1. [none]
2. [none]

FMT\_PWD.1.2 The TSF shall restrict the ability to manage the ID of [none] to [none].

1. [none]
2. [none]

FMT\_PWD.1.3 The TSF shall provide the capability for [changing the password when the authorized administrator accesses for the first time].

### 5.1.5.4 FMT\_SMF.1 Specification of Management Functions

Hierarchical to No other components

Dependencies No dependencies.

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

FMT\_SMF.1.1 The TSF shall be capable of performing the following management functions: [  
FMT\_MOF.1 Specified items in security function management,  
FMT\_MTD.1 Specified items in TSF data management  
]

### 5.1.5.5 FMT\_SMR.1 Security roles

Hierarchical to No other components.  
Dependencies FIA\_UID.1 Timing of identification

FMT\_SMR.1.1 The TSF shall maintain the roles [The following authorized administrators].

- Super Manager
- Policy Manager
- Cryptographic Manager
- System Manager
- Audit Manager

FMT\_SMR.1.2 TSF shall be able to associate users and their **roles defined in FMT\_SMR.1.1.**

## 5.1.6 Protection of the TSF(FPT)

### 5.1.6.1 FPT\_ITT.1 Basic internal TSF data transfer protection

Hierarchical to No other components  
Dependencies No dependencies.

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

FPT\_ITT.1.1 The TSF shall protect the TSF data from disclosure, modification **by verifying encryption and message integrity** when the TSF data is transmitted among TOE's separated parts.

### 5.1.6.2 FPT\_PST.1 Basic protection of stored TSF data (Extended)

Hierarchical to No other components.

Dependencies No dependencies.

FPT\_PST.1.1 The TSF shall protect [TSF data] stored in containers controlled by the TSF from the unauthorized disclosure, modification.

### 5.1.6.3 FPT\_TST.1 TSF testing

Hierarchical to No other components.

Dependencies No dependencies.

FPT\_TST.1.1 The TSF shall run a suite of self tests during initial start-up, periodically during normal operation to demonstrate the correct operation of [TOE integrity test object (library files, Config File)].

FPT\_TST.1.2 The TSF shall provide authorized administrators with the capability to verify the integrity of [TOE integrity test object (Config File)].

FPT\_TST.1.3 The TSF shall provide authorized administrators with the capability to verify the integrity of [TOE integrity test object (library files)].

## 5.1.7 TOE access(FTA)

### 5.1.7.1 FTA\_MCS.2 Per user attribute limitation on multiple concurrent sessions

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

Hierarchical to FTA\_MCS.1 Basic limitation on multiple concurrent sessions

Dependencies FIA\_UID.1 Timing of identification

FTA\_MCS.2.1 The TSF shall restrict the maximum number of concurrent sessions [belonging to the same administrator according to the rules for the list of management functions defined in FMT\_SMF1.1]

a) limit the maximum number of concurrent sessions to 1 for management access by the same administrator who has the right to perform FMT\_MOF.1.1 "Management actions" and FMT\_MTD.1.1 "Management."

b) limit the maximum number of concurrent sessions to {1} for management access by the same administrator who doesn't have the right to perform FMT\_MOF.1.1 "Management actions" but has the right to perform a query in FMT\_MTD.1.1 "Management" only

c) [none]

FTA\_MCS.2.2 The TSF shall enforce a limit of [1] session per administrator by default.

### 5.1.7.2 FTA\_SSL.5 Management of TSF-initiated sessions(Extended)

Hierarchical to No other components.

Dependencies FIA\_UAU.1 authentication or No dependencies.

FTA\_SSL.5.1 The TSF shall [lock the session] the administrator's interactive session after a [assignment: time interval of the administrator inactivity : 10(mins)].

### 5.1.7.3 FTA\_TSE.1 TOE session establishment

Hierarchical to No other components.

Dependencies No dependence

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

FTA\_TSE.1.1 The TSF shall be able to refuse the management access session of the administrator, based on [Access IP, [the status of activating the management access session of the administrator having the same rights, Exit the existing sub-manager session when accessing the super administrator]].

 <b>KSIGN</b> <i>e-Security Leader</i>	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul

## 5.2 Security assurance requirements

The assurance requirements of this ST are composed of assurance components of CC Part. The evaluation assurance level is EAL1 +. The following table summarizes the assurance components.

Security functional class	Security functional component	
Security Target evaluation	ASE_INT.1	ST introduction
	ASE_CCL.1	Conformance claims
	ASE_OBJ.1	Security objectives for the operational environment
	ASE_ECD.1	Extended components definition
	ASE_REQ.1	Stated security requirements
	ASE_TSS.1	TOE summary specification
Development	ADV_FSP.1	Basic functional specification
Guidance documents	AGD_OPE.1	Operational user guidance
	AGD_PRE.1	Preparative procedures
Life-cycle support	ALC_CMC.1	Labelling of the TOE
	ALC_CMS.1	TOE CM coverage
Tests	ATE_FUN.1	Functional testing
	ATE_IND.1	Independent testing - conformance
Vulnerability assessment	AVA_VAN.1	Vulnerability survey

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

## 5.2.1 Security Target evaluation

### 5.2.1.1 ASE\_INT.1 introduction

Dependencies No dependencies.

#### Developer action elements

ASE\_INT.1.1D The developer shall provide an ST introduction.

#### Content and presentation elements

ASE\_INT.1.1C The ST introduction shall contain an ST reference, a TOE reference, a TOE overview and a TOE description.

ASE\_INT.1.2C The ST reference shall uniquely identify the ST.

ASE\_INT.1.3C The TOE reference shall uniquely identify the TOE.

ASE\_INT.1.4C The TOE overview shall summarise the usage and major security features of the TOE.

ASE\_INT.1.5C The TOE overview shall identify the TOE type.

ASE\_INT.1.6C The TOE overview shall identify any non-TOE hardware/software/firmware required by the TOE.

ASE\_INT.1.7C The TOE description shall describe the physical scope of the TOE.

ASE\_INT.1.8C The TOE description shall describe the logical scope of the TOE.

#### Evaluator action elements

ASE\_INT.1.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ASE\_INT.1.2E The evaluator shall confirm that the TOE reference, the TOE overview, and the TOE description are consistent with each other.

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

### 5.2.1.2 ASE\_CCL.1 Conformance claims

Dependencies	ASE_INT.1 ST introduction
	ASE_ECD.1 Extended components definition
	ASE_REQ.1 Stated security requirements

#### Developer action elements

- ASE\_CCL.1.1D The developer shall provide a conformance claim.
- ASE\_CCL.1.2D The developer shall provide a conformance claim rationale.

#### Content and presentation elements

- ASE\_CCL.1.1C The conformance claim shall contain a CC conformance claim that identifies the version of the CC to which the ST and the TOE claim conformance.
- ASE\_CCL.1.2C The CC conformance claim shall describe the conformance of the ST to CC Part 2 as either CC Part 2 conformant or CC Part 2 extended.
- ASE\_CCL.1.3C The CC conformance claim shall describe the conformance of the ST to CC Part 3 as either CC Part 3 conformant or CC Part 3 extended.
- ASE\_CCL.1.4C The CC conformance claim shall be consistent with the extended components definition.
- ASE\_CCL.1.5C The conformance claim shall identify all PPs and security requirement packages to which the ST claims conformance.
- ASE\_CCL.1.6C The conformance claim shall describe any conformance of the ST to a package as either package-conformant or package-augmented.
- ASE\_CCL.1.7C The conformance claim rationale shall demonstrate that the TOE type is consistent with the TOE type in the PPs for which conformance is being claimed.

 <b>KSIGN</b> <i>e-Security Leader</i>	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

ASE\_CCL.1.8C The conformance claim rationale shall demonstrate that the statement of the security problem definition is consistent with the statement of the security problem definition in the PPs for which conformance is being claimed.

ASE\_CCL.1.9C The conformance claim rationale shall demonstrate that the statement of security objectives is consistent with the statement of security objectives in the PPs for which conformance is being claimed.

ASE\_CCL.1.10C The conformance claim rationale shall demonstrate that the statement of security requirements is consistent with the statement of security requirements in the PPs for which conformance is being claimed.

**Evaluator action elements**

ASE\_CCL.1.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

**5.2.1.3 ASE\_OBJ.1 Security objectives for the operational environment**

Dependencies No dependencies.

**Developer action elements**

ASE\_OBJ.1.1D The developer shall provide a statement of security objectives.

**Content and presentation elements**

ASE\_OBJ.1.1C The statement of security objectives shall describe the security objectives for the operational environment.

**Evaluator action elements**

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

ASE\_OBJ.1.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

#### 5.2.1.4 ASE\_ECD.1 Extended components definition

Dependencies No dependencies.

##### Developer action elements

ASE\_ECD.1.1D The developer shall provide a statement of security requirements.

ASE\_ECD.1.2D The developer shall provide an extended components definition.

##### Content and presentation elements

ASE\_ECD.1.1C The statement of security requirements shall identify all extended security requirements. ASE\_ECD.1.2C The extended components definition shall define an extended component for each extended security requirement.

ASE\_ECD.1.3C The extended components definition shall describe how each extended component is related to the existing CC components, families, and classes.

ASE\_ECD.1.4C The extended components definition shall use the existing CC components, families, classes, and methodology as a model for presentation.

ASE\_ECD.1.5C The extended components shall consist of measurable and objective elements such that conformance or nonconformance to these elements can be demonstrated.

##### Evaluator action elements

ASE\_ECD.1.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ASE\_ECD.1.2E The evaluator shall confirm that no extended component can be clearly expressed using existing components.

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

### 5.2.1.5 ASE\_REQ.1 Stated security requirements

Dependencies ASE\_ECD.1 Extended components definition

#### Developer action elements

ASE\_REQ.1.1D The developer shall provide a statement of security requirements.

ASE\_REQ.1.2D The developer shall provide a security requirements rationale.

#### Content and presentation elements

ASE\_REQ.1.1C The statement of security requirements shall describe the SFRs and the SARs.

ASE\_REQ.1.2C All subjects, objects, operations, security attributes, external entities and other terms that are used in the SFRs and the SARs shall be defined.

ASE\_REQ.1.3C The statement of security requirements shall identify all operations on the security requirements.

ASE\_REQ.1.4C All operations shall be performed correctly.

ASE\_REQ.1.5C Each dependency of the security requirements shall either be satisfied, or the security requirements rationale shall justify the dependency not being satisfied.

ASE\_REQ.1.6C The statement of security requirements shall be internally consistent.

#### Evaluator action elements

ASE\_REQ.1.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

### 5.2.1.6 ASE\_TSS.1 TOE summary specification

Dependencies ASE\_INT.1 ST introduction  
ASE\_REQ.1 Stated security requirements  
ADV\_FSP.1 Basic functional specification

#### Developer action elements

ASE\_TSS.1.1D The developer shall provide a TOE summary specification Evaluator action elements  
ASE\_TSS.1.1C The TOE summary specification shall describe how the TOE meets each SFR.

#### Evaluator action elements

ASE\_TSS.1.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.  
ASE\_TSS.1.2E The evaluator shall confirm that the TOE summary specification is consistent with the TOE overview and the TOE description.

## 5.2.2 Development

### 5.2.2.1 ADV\_FSP.1 Basic functional specification

Dependencies No dependencies.

#### Developer action elements

ADV\_FSP.1.1D The developer shall provide a functional specification.  
ADV\_FSP.1.2D The developer shall provide a tracing from the functional specification to the SFRs.

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

### Content and presentation elements

- ADV\_FSP.1.1C The functional specification shall describe the purpose and method of use for each SFR-enforcing and SFR-supporting TSFI.
- ADV\_FSP.1.2C The functional specification shall identify all parameters associated with each SFR-enforcing and SFR-supporting TSFI.
- ADV\_FSP.1.3C The functional specification shall provide rationale for the implicit categorization of interfaces as SFR-non-interfering.
- ADV\_FSP.1.4C The tracing shall demonstrate that the SFRs trace to TSFIs in the functional specification.

### Evaluator action elements

- ADV\_FSP.1.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.
- ADV\_FSP.1.2E The evaluator shall determine that the functional specification is an accurate and complete instantiation of the SFRs.

## 5.2.3 Guidance documents

### 5.2.3.1 AGD\_OPE.1 Operational user guidance

Dependencies ADV\_FSP.1 Basic functional specification

### Developer action elements

- AGD\_OPE.1.1D The developer shall provide operational user guidance.

### Content and presentation elements

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

- AGD\_OPE.1.1C The operational user guidance shall describe, for each user role, the user-accessible functions and privileges that should be controlled in a secure processing environment, including appropriate warnings.
- AGD\_OPE.1.2C The operational user guidance shall describe, for each user role, how to use the available interfaces provided by the TOE in a secure manner.
- AGD\_OPE.1.3C The operational user guidance shall describe, for each user role, the available functions and interfaces, in particular all security parameters under the control of the user, indicating secure values as appropriate.
- AGD\_OPE.1.4C The operational user guidance shall, for each user role, clearly present each type of security-relevant event relative to the user-accessible functions that need to be performed, including changing the security characteristics of entities under the control of the TSF.
- AGD\_OPE.1.5C The operational user guidance shall identify all possible modes of operation of the TOE (including operation following failure or operational error), their consequences and implications for maintaining secure operation.
- AGD\_OPE.1.6C The operational user guidance shall, for each user role, describe the security measures to be followed in order to fulfil the security objectives for the operational environment as described in the ST.
- AGD\_OPE.1.7C The operational user guidance shall be clear and reasonable.

**Evaluator action elements**

- AGD\_OPE.1.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

**5.2.3.2 AGD\_PRE.1 Preparative procedures**

Dependencies No dependencies

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

### Developer action elements

AGD\_PRE.1.1D The developer shall provide the TOE including its preparative procedures.

### Content and presentation elements

AGD\_PRE1.1C The preparative procedures shall describe all the steps necessary for secure acceptance of the delivered TOE in accordance with the developer's delivery procedures.

AGD\_PRE1.2C The preparative procedures shall describe all the steps necessary for secure installation of the TOE and for the secure preparation of the operational environment in accordance with the security objectives for the operational environment as described in the ST.

### Evaluator action elements

AGD\_PRE.1.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

AGD\_PRE.1.2E The evaluator shall apply the preparative procedures to confirm that the TOE can be prepared securely for operation.

## 5.2.4 Life-cycle support

### 5.2.4.1 ALC\_CMC.1 TOE Labelling of the TOE

Dependencies ALC\_CMS.1 TOE CM coverage

### Developer action elements

ALC\_CMC.1.1D The developer shall provide the TOE and a reference for the TOE.

### Content and presentation elements

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

ALC\_CMC.1.1C The TOE shall be labelled with its unique reference.

**Evaluator action elements**

ALC\_CMC.1.1E The evaluator shall confirm that the information provided meet requirements for content and presentation of evidence.

**5.2.4.2 ALC\_CMS.1 TOE CM coverage**

Dependencies No dependencies.

**Developer action elements**

ALC\_CMS.1.1D The developer shall provide a configuration list for the TOE.

**Content and presentation elements**

ALC\_CMS.1.1C The configuration list shall include the following: the TOE itself; and the

**evaluation evidence required by the SARs.**

ALC\_CMS.1.2C The configuration list shall uniquely identify the configuration items.

**Evaluator action elements**

ALC\_CMS.1.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

**5.2.5 Tests**

**5.2.5.1 ATE\_FUN.1 Functional testing**

Dependencies ATE\_COV.1 Evidence of coverage

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

### Developer action elements

ATE\_FUN.1.1D The developer shall test the TSF and document the results.

ATE\_FUN.1.2D The developer shall provide test documentation.

### Content and presentation elements

ATE\_FUN.1.1C The test documentation shall consist of test plans, expected test results and actual test results.

ATE\_FUN.1.2C The test plans shall identify the tests to be performed and describe the scenarios for performing each test. These scenarios shall include any ordering dependencies on the results of other tests.

ATE\_FUN.1.3C The expected test results shall show the anticipated outputs from a successful execution of the tests.

ATE\_FUN.1.4C The actual test results shall be consistent with the expected test results.

### Evaluator action elements

ATE\_FUN.1.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

## 5.2.5.2 ATE\_IND.1 Independent testing - conformance

Dependencies ADV\_FSP.1 Basic functional specification

AGD\_OPE.1 Operational user guidance

AGD\_PRE.1 Preparative procedures

### Developer action elements

ATE\_IND.1.1D The developer shall provide the TOE for testing.

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

### Content and presentation elements

ATE\_IND.1.1C The TOE shall be suitable for testing.

### Evaluator action elements

ATE\_IND.1.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

ATE\_IND.1.2E The evaluator shall test a subset of the TSF to confirm that the TSF operates as specified.

## 5.2.6 Vulnerability assessment

### 5.2.6.1 AVA\_VAN.1 Vulnerability survey

Dependencies ADV\_FSP.1 Basic functional specification  
AGD\_OPE.1 Operational user guidance  
AGD\_PRE.1 Preparative procedures

### Developer action elements

AVA\_VAN.1.1D The developer shall provide the TOE for testing

### Content and presentation elements

AVA\_VAN.1.1C The TOE shall be suitable for testing.

### Evaluator action elements

AVA\_VAN.1.1E The evaluator shall confirm that the information provided meets all requirements for content and presentation of evidence.

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

AVA\_VAN.1.2E The evaluator shall perform a search of public domain sources to identify potential vulnerabilities in the TOE.

AVA\_VAN.1.3E The evaluator shall conduct penetration testing, based on the identified potential vulnerabilities, to determine that the TOE is resistant to attacks performed by an attacker possessing Basic attack potential.

## 5.3 Security requirements rationale

### 5.3.1 Dependency rationale of security functional requirements

The following table shows dependency of security functional requirements

No.	Security functional requirements	Dependency	Reference No.
1	FAU_ARP.1	FAU_SAA.1	3
2	FAU_GEN.1	FPT_STM.1	OE.Timestemp
3	FAU_SAA.1	FAU_GEN.1	2
4	FAU_SAR.1	FAU_GEN.1	2
5	FAU_SAR.3	FAU_SAR.1	4
6	FAU_STG.3	FAU_STG.1	OE.DBMS
7	FAU_STG.4	FAU_STG.1	OE.DBMS

		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

- FAU\_GEN.1 has the dependency on FPT\_STM.1, which is satisfied by the security objective OE. Time stamp for the operating environment. Because Records security related tests using reliable time stamps provided by the TOE operating environment.
- FAU\_STG.3 and FAU\_STG.4 have the dependency on FAU\_STG.1 that is satisfied by the security objective OE.DBMS for the operational environment.
- FCS\_COP.1(3) and FCS\_COP.1(6) have the dependency on FDP\_ITC.1, FDP\_ITC.2, or FCS\_CKM and FCS\_CKM.4 that is satisfied because the Hash algorithm does not use the encryption key.
- FIA\_AFL.1 and FIA\_UAU.7 have the dependency on FIA\_UAU.1, which is satisfied by FIA\_UAU.2 in hierarchical relationship with FIA\_UAU.1.
- FIA\_UAU.2, FMT\_SMR.1 and FTA\_MCS.2 have the dependency on FIA\_UAU.1, which is satisfied by FIA\_UAU.2 in hierarchical relationship with FIA\_UAU.1.
- FTA\_SSL.5 has the dependency on FIA\_UAU.1, which is satisfied by FIA\_UAU.2 in hierarchical relationship with FIA\_UAU.1.

### 5.3.2 Dependency rationale of security assurance requirements

The dependency of EAL1 assurance package provided in the CC is already satisfied, the rationale is omitted.

The augmented SAR ATE\_FUN.1 has dependency on ATE\_COV.1. but, ATE\_FUN.1 is augmented to require developer testing in order to check if the developer correctly performed and documented the tests in the test documentation, ATE\_COV.1 is not included in this PP since it is not necessarily required to show the correspondence between the tests and the TSFIs.

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

## 6. TOE Summary Specification

This chapter describes the SFRs of the TOE; security functions that satisfy the security assurance components; and the assurance methods

### 6.1 Security Alert

The TOE adopts the SFRs and provides the function of audit data generation, audit record review, audit data loss prevention, alert log and alert log settings for the auditable events. In addition, it manages the file system in which the audit data are stored in order to protect the audit data.

#### 6.1.1 Audit data generation

The TOE generates the audit data for the auditable events that occur during the operation. The generated audit data are stored in the storage (DBMS). The TOE uses a reliable time stamp (the time in the OS where the Server is installed) provided by the TOE operational environment to ensure that the audit data are generated sequentially.

Auditable events are generated and stored, based on the review period, task target, table owner, task type, task manager, IP, task outcome (success/failure of the event).

The generated auditable events are as follows

Security functional component	Auditable event	Additional audit record
FAU_ARP.1	Actions taken due to potential security violations	
FAU_SAA.1	Enabling and disabling of any of the analysis mechanisms, Automated responses performed by the tool	
FAU_STG.3	Actions taken due to exceeding of a threshold	
FAU_STG.4	Actions taken due to the audit storage failure	
FCS_CKM.1	Success and failure of the activity	

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

FCS_CKM.2	Success and failure of the activity (only applying to distribution of key related to user data encryption/decryption)	
FCS_CKM.4	Success and failure of the activity (only applying to destruction of key related to user data encryption/decryption)	
FCS_COP.1	Success and failure of the activity	
FDP_UDE.1	Success and failure of user data encryption/decryption	
FIA_AFL.1	The reaching of the threshold for the unsuccessful authentication attempts and the actions taken, and the subsequent, if appropriate, restoration to the normal state	
FIA_IMA.1	Success and failure of mutual authentication Modify of authentication protocol	
FIA_UAU.2	All use of the authentication mechanism	
FIA_UAU.4	Attempts to reuse authentication data	
FIA_UID.2	All use of the administrator identification mechanism, including the administrator identity provided

### 6.1.2 Audit data review

The TOE stores the audit data in the audit trail storage (DBMS) and provides the function for the authorized administrator to review all audit data so that the administrator can appropriately interpret the information from the audit records. It also allows the audit data review based on AND conditions with the review period, task target (agent, table owner), task type, task manager, IP and task outcome.

The authorized administrator (top administrator, audit record review administrator) can review and search the audit data by using the security management interface in KSignSecureDB Server.

### 6.1.3 Audit data loss prevention

The audit records generated by the TOE are stored in the storage (DBMS) provided by the TOE operational environment. Only the authorized administrator can access the audit record DB through the storage and assemble audit records.

The TOE checks the space in the audit record storage on a periodic basis; generates audit records on an event that exceeds the storage if it exceeds the threshold of the remaining space in the storage defined by the authorized administrator; and sends an alert (warning email) to the authorized administrator. If the audit trail is full, the TOE ignores the audit detail to protect the audit records and sends an alert (warning email) to the authorized administrator.

- If the audit data reaches the default threshold of 80% of the total audit record storage capacity (based on the tablespace), an alert (warning email) is sent to the authorized administrator. It is not allowed to change the default value.

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

- If the audit trail fills up the default threshold of 90% of the total audit record storage capacity (based on the tablespace), it ignores events audited at the time when the audit trail is full and sends an alert (warning email) to the authorized administrator. It is not allowed to change the default value.

### 6.1.4 Security Audit

The TOE applies a combination of rules that indicate potential security violations in the audit data, and performs security alarm by sending an alert email to the administrator defined in case of a violation. Potential security violations are as follows:

- When the administrator authentication has failed;
- When the threshold of the defined number of unsuccessful authentication attempts has been reached;
- When a user access control policy has been violated;
- When the threshold of the audit trail storage has been exceeded or full;
- When the integrity verification of the TOE configuration files has failed;
- When the license verification has failed;

### 6.1.5 SFR Mapping

SFR to be satisfied: FAU\_ARP.1, FAU\_GEN.1, FAU\_SAA.1, FAU\_SAR.1, FAU\_SAR.3, FAU\_SEL.1, FAU\_STG.1, FAU\_STG.3, FAU\_STG.4

 <b>KSIGN</b> <small>ℓ-Security Leader</small>	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10

## 6.2 Password Function Support

The TOE supports cryptography using the verified cryptographic module KSignCrypto for Java V1.0.1.0 in the policy transmission interval for the cryptographic support between the TOE components. Details of the verified cryptographic module included in the TOE are as follows.

Item	Specification
Cryptographic module name	KSignCrypto for Java V1.0.1.0
Developer	KSign Co., Ltd.
Validation date	May 08, 2020
Validation level	VSL1
Validation number	CM-167-2025.5

### 6.2.1 Cryptographic Support

The object that communicates for the protection of the TSF data transmitted inside the TOE generates the certificate(private key and public key); encrypts the TSF data with SEED-CBC algorithm after completing mutual authentication using a certificate; sends the data and verifies the integrity of the transmitted data through the one-way algorithm (SHA-256); and decrypts the encrypted data by using certificate.

The user data and TSF data are encrypted by the symmetric key cryptographic operation. For this purpose, the 128-bit cryptographic key is generated through HMAC(SHA256) and HASH\_DRBG algorithms in PBKDF2 of PKCS#5, which complies with ISO/IEC 18031(2011) and NIST SP 800-90 standards.

When a cryptographic key necessary for the asymmetric key cryptographic operations generated, 2048-bit cryptographic key is generated through RSAES algorithm that complies with ISO/IEC 18033-2(2006) standard.

A cryptographic key managed in KSignSecureDB Server is encrypted with SEED-CBC algorithm and stored and managed in the DBMS, and its integrity is verified by using SHA256 algorithm. The cryptographic key is stored in a form encrypted with SEED-CBC algorithm in the memory upon the start-up of KSignSecureDB Server, and is decrypted, if necessary, for the purpose of encryption, decryption, key provision, etc. The decrypted key values are deleted (zeroized) from the memory after the use.

 <b>KSIGN</b> <i>ℓ-Security Leader</i>	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

The master key used for the encryption of the cryptographic key is encrypted through RSAES (2048bit) and managed in the DBMS. Only the authorized administrator can access or modify the master key.

The validated cryptographic module is used for the supported cryptographic algorithm, and the information on algorithms by use is as follows.

Category		algorithm	Key length	Standard
<b>mutual authentication (KSignSecureDB Server ↔ KSignSecureDB DBAgent) (KSignSecureDB Server ↔ KSignSecureDB APIAgent)</b>	Data Encryption (DEK)	SEED (CBC)	128bit	TTAS.KO-12.0004
	Key exchange	RSAES	2048bit	ISO/IEC 18033-2
	Integrity (Agent)	SHA256	N/A	ISO/IEC 10118-3
<b>Key Encryption Key (KEK) – Password key derivation</b>		HMAC_SHA256	256bit	TTAK.KO-12.0334
<b>Key Encryption Key (KEK) – Master key</b>		RSAES	2048bit	ISO/IEC 18033-2
<b>Data Encryption Key (DEK)</b>		SEED (CBC)	128bit	TTAS.KO-12.0004
<b>Encrypting user data</b>		SEED (CBC)	128bit	TTAS.KO-12.0004
		ARIA (CBC)	128/192/256bit	KS X 1213
		SHA256/512	N/A	ISO/IEC 10118-3
<b>Encrypt TSF data</b>		SEED (CBC)	128bit	TTAS.KO-12.0004/R1
<b>Store administrator password</b>		SHA256	N/A	ISO/IEC 10118-3
<b>TOE module integrity</b>		SHA256	N/A	

 <b>KSIGN</b> <small>ℓ-Security Leader</small>	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

## 6.2.2 Cryptographic key destruction

If a cryptographic key loaded on the memory upon key generation, distribution and operation expires, its random bits are all overwritten with 0x00 to destroy the cryptographic key.

- The cryptographic key-related information is deleted:

Standard list	Cryptographic key storage location	Destruction method	Destruction object	Destruction point
N/A	DB	Overwrite everything with "0x00"	User date encryption key(policy key)	When the administrator deletes the security policy
N/A	Memory	Overwrite everything with "0x00"	Public key, policy key, TSF DEK	When calling process shutdown or logout function
N/A	Memory	Overwrite everything with "0x00"	Session key	At the end of communication
N/A	Memory	Overwrite everything with "0x00"	Policy key TSF DEK	Immediately after cryptographic operation

## 6.2.3 Random generate

The TOE uses HASH\_DRBG (256 bits) algorithm through the random number generator of the validated cryptographic module KSignCrypto for Java V1.0.1.0 whose safety and suitability for the implementation have been confirmed by the cryptographic module validation scheme, and generates random numbers necessary for generating cryptographic keys.

## 6.2.4 SFR Mapping

SFR to be satisfied: FCS\_CKM.1, FCS\_CKM.2, FCS\_CKM.4, FCS\_COP.1, FCS\_RBG.1(Extended)

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

## 6.3 Protection of the TSF

### 6.3.1 Protection of the TSF

The TOE provides the function of encrypting/decrypting the data stored in the DBMS under the protection by the unit of column by using KSignCrypto for Java V1.0.1.0, a validated cryptographic module, and generates different ciphertext values for the same plaintexts. In addition, it offers the function of blocking or allowing access to the DBMS under the protection in accordance with the security policy defined by the user.

Furthermore, it protects the user data by deleting the original data to be encrypted in the DBMS under the protection during the user data encryption.

### 6.3.2 SFR Mapping

SFR to be satisfied: FDP\_UDE.1, FDP\_RIP.1

## 6.4 Identification and Authentication

### 6.4.1 Identification and Authentication

The authorized administrator shall be identified through the administrator authentication (ID, password) to be allowed to perform the security management, and cannot use any security management function without undergoing such authentication process. The administrator authentication information is transmitted through a web-based browser, and the authentication information is securely transmitted through the HTTPS communication between the web browser and KSignSecureDB Server.

If the administrator login attempts are unsuccessful for five times, the TOE locks the account for ten minutes. If the identification and authentication succeed normally after ten minutes, the account is unlocked.

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

## 6.4.2 Protection of authentication data

The TOE provides the following to protect the feedback when the administrator password is entered:

- The password used for the authentication is masked with "●" to prevent them from being disclosed.
- It does not provide a reason for authentication failure in case of an unsuccessful authentication attempt.

The TOE provides the following to prevent the reuse of the administrator authentication information:

- Prevention of the reuse of the administrator authentication information: To avoid a CSRF (Cross Side Request Forgery) attack, the TOE allocates a nonce to each page prior to the administrator authentication, and limits access if the allocated nonce is not transmitted together.

## 6.4.3 Password policy validation

The validity of password values is verified in accordance with the defined password combination rules when the administrator password is generated or modified.

The TOE provides the following verification mechanisms in generating passwords:

- Password length: From 10 up to 30 digits consisting of a combination of uppercase and lowercase English alphabets, numbers and special characters
- Uppercase English alphabets: A – Z (26)
- Lowercase English alphabets: a – z (26)
- Numbers: 0 – 9 (10)
- Special characters: !, @, #, \$, %, ^, \* (7)
- Verifying password rules : Combination of English characters (capital letter, small letter), numbers, and special characters use three or more combinations and lengths must be 10 to 30 digits

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

## 6.4.4 Mutual authentication

The TOE performs mutual authentication through mutual authentication protocol between KSignSecureDB Server (hereinafter referred to as "Server"), KSignSecureDB DBAgent and KSignSecureDB APIAgent (hereinafter referred to as "Agent"), and the detailed mechanism is as follows.

1. KSignSecureDB DBAgent or APIAgent transfers the Agent Flag value to KSignSecureDB Server, together with a Hello message.
2. Agent Flag is the data that encrypted nonce values, the current time, unique code values and checksum (SHA256) with the certificate in order to prevent MITM (man-in-the-middle) or reply attacks.
3. After KSignSecureDB Server receives the Agent Flag value, it decrypts the value and verifies the Flag value.
4. The Flag value is verified by decrypting the value received from the Agent with the certificate to check the value from the Agent; checking if the time value that indicates when it was encrypted and sent matches the time value that indicates when it was sent as plaintexts; and checking the SHA256 checksum value for the transmitted data and the unique code value.
5. The communication is terminated if the Flag value verification fails. A Hello response (ack + received nonce value) message is sent to KSignSecureDB DBAgent or APIAgent if the Flag value verification succeeds.
6. KSignSecureDB DBAgent or APIAgent that received the response message decrypts the nonce value with the certificate to ensure it is the value that it sent. If not, it terminates the communication. Otherwise, the mutual authentication process is complete.

## 6.4.5 SFR Mapping

SFR to be satisfied: FIA\_AFL.1, FIA\_SOS.1, FIA\_UAU.1, FIA\_UAU.4, FIA\_UAU.7, FIA\_UID.1

		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

## 6.5 Security Management

### 6.5.1 Security function management

The TOE calls the function of the security management access control only if the self-enforced identification and authentication are successfully carried out. Only an administrator permitted by the authorized administrator (top administrator) is allowed to access the security management interface through a secure channel (SSL).

The roles of the authorized administrator provided by the TOE are as follows:

- Top administrator
- Policy administrator
- System administrator
- Encryption administrator
- Audit record review administrator

The TOE provides the management function of each administrator role for the authorized administrator regarding the following security functions.

SFR Component	Management function	Administrator Type
FAU_ARP.1	Management of actions	Top Administrator
FAU_SAA.1	Maintenance of the rules	Top Administrator
FAU_SAR.1	Maintenance of the group of users with read access right to the audit records	Top Administrator, Audit Administrator
FAU_STG.3	Maintenance of actions to be taken in case of imminent audit storage failurer	Top Administrator
FAU_STG.4	Maintenance of actions to be taken in case of audit storage failure	Top Administrator
FIA_AFL.1	Management of the threshold for unsuccessful authentication attempts	Top Administrator
	Management of actions to be taken in the event of an authentication failure	Top Administrator

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

FIA_SOS.1	Management of the metric used to verify the secrets	Top Administrator
FIA_UAU.2	Management of the authentication data by an administrator	Top Administrator
FIA_UID.2	Management of the administrator and end-user identities	Top Administrator
FMT_MOF.1	Management of the group of roles that can interact with the functions in the TSF	Top Administrator
FMT_MTD.1	Management of the group of roles that can interact with the TSF data	Top Administrator
FMT_SMR.1	Management of the group of users that are part of a role	Top Administrator
FPT_ITT.1	Management of the mechanism used to provide the protection of the data in transit between different parts of the TSF	Top Administrator
FPT_TST.1	Management of the conditions under which TSF self testing occurs, such as during initial start-up, regular interval, or under specified conditions Management of the time interval if appropriate	Top Administrator

## 6.5.2 ID and password management

It is enforced that the authorized administrator changes the password upon the initial access to the security management interface. The authorized administrator (top administrator, system administrator) can change the administrator password through the security management interface.

The validity of password values is verified in accordance with the defined password combination rules when the administrator password is generated or modified. The TOE provides the following verification mechanisms in generating passwords:

- Password length: From 10 up to 30 digits consisting of a combination of uppercase and lowercase English alphabets, numbers and special characters
- Uppercase English alphabets: A – Z (26)
- Lowercase English alphabets: a – z (26)

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

- Numbers: 0 – 9 (10)
- Special characters: !, @, #, \$, %, ^, \* (7)
- Verifying password rules : Combination of English characters (capital letter, small letter), numbers, and special characters use three or more combinations and lengths must be 10 to 30 digits

### 6.5.3 SFR Mapping

SFR to be satisfied: FMT\_MOF.1, FMT\_MSA.1, FMT\_MSA.3, FMT\_MTD.1, FMT\_PWD.1(Extended), FMT\_SMF.1, FMT\_SMR.1

## 6.6 Protection of the TSF

### 6.6.1 Internal TSF data transfer protection

The TOE performs KSign-implemented encrypted communication (SSL) for policy transfer with the aim of the internal TSF data transfer protection, and protects the communication by using the validated cryptographic module KSignCrypto for Java V1.0.1.0 as follows:

1. KSignSecureDB DBAgent or APIAgent transfers the Agent Flag value to KSignSecureDB Server, together with a Hello message.
2. Agent Flag is the data that encrypted nonce values, the current time, unique code values and checksum (SHA256) with the certificate in order to prevent MITM (man-in-the-middle) or reply attacks.
3. After KSignSecureDB Server receives the Agent Flag value, it decrypts the value and verifies the Flag value.
4. The Flag value is verified by decrypting the value received from the Agent with the certificate to check the value from the Agent; checking if the time value that indicates when it was encrypted and sent matches the time value that indicates when it was sent as plaintexts; and checking the SHA256 checksum value for the transmitted data and the unique code value.

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

5. The communication is terminated if the Flag value verification fails. A Hello response (ack + received nonce value) message is sent to KSignSecureDB DBAgent or APIAgent if the Flag value verification succeeds.
6. KSignSecureDB DBAgent or APIAgent that received the response message decrypts the nonce value with the certificate to ensure it is the value that it sent. If not, it terminates the communication. Otherwise, the Session Key (SEED-CBC, 128 bits) is generated by the random number generator in the validated cryptographic module.
7. The generated Session Key performs the encryption (RSAES, 2048 bites) with the certificate.
8. KSignSecureDB DBAgent or APIAgent generates the hash value (SHA256) of the Session Key encrypted with the certificate and transfers the encrypted Session Key and the hash value to KSignSecureDB Server.
9. KSignSecureDB Server generates the hash value (SHA256) of the Session Key received from KSignSecureDB DBAgent or APIAgent, and compares it against the received hash value to verify whether they match or not.
10. KSignSecureDB Server compares the hash values. If they do not match, the communication is terminated. If they match, it decrypts (RSAES, 2048 bits) the Session Key encrypted with its private key.
11. KSignSecureDB Server and KSignSecureDB DBAgent or APIAgent send and receive the data by encrypting them with the Session Key shared between the two parties.
12. When sending or receiving the data encrypted with the Session Key between KSignSecureDB Server and KSignSecureDB DBAgent or APIAgent, hash values for the encrypted data and the corresponding data are generated (SHA256) to make sure that they match.
13. If the hash values match, the data are decrypted (SEED-CBC, 128 bits) with the shared Session Key to obtain the plaintexts. If not, the communication is terminated.
14. The Session Key generated in each stage destroys the cryptographic key by initializing the memory variables with 0x00 after the use. In case the communication is cut off in KSignSecureDB Server and KSignSecureDB DBAgent or APIAgent, the memory variable of the corresponding Session Key is initialized with 0x00 so that the cryptographic key is normally destroyed.

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

## 6.6.2 Protection of stored TSF data

The TOE stores and manages the TSF data to be protected by encrypting them in order to protect the stored TSF data from unauthorized disclosure or modification.

Information required to be encrypted includes administrator passwords, TOE set value information (DB storage information and configuration file information) and so on. An administrator password is encrypted with SHA256, and the TOE set value information is encrypted with SEED-CBC 128 bits.

The TOE set values are included in and exist inside KSignSecureDB Server, KSignSecureDB DBAgent and KSignSecureDB APIAgent, which are the TOE components.

Information required to be encrypted, from configuration file information in KSignSecureDB Server, includes web server SSL certificate storage path, certificate password, DB URL, DB account ID and DB account password. Information managed in the Server policy database and required to be encrypted includes Agent IP, Agent port, Agent installation path, policy DB port, policy DB service name, security administrator account, security administrator password, JDBC URL, Administrator account and administrator password.

Information located inside the configuration file of KSignSecureDB DBAgent and required to be encrypted includes domain name, basic agent path, agent IP address, agent port, server IP address, server port, shared memory ID and certificate password.

Information located inside the configuration file of KSignSecureDB APIAgent and required to be encrypted include basic agent path, agent IP address, agent port, server IP address, server port, shared memory ID and certificate password.

The data encryption key (DEK) for the protection of the TSF data encrypts the TOE set values with SEED-CBC 128 bits.

The data encryption key (DEK) for the protection of the TSF data is securely encrypted and protected with the SEED-CBC 128-bit key encryption key (KEK).

The TSF data encryption key (DEK) and the key encryption key (KEK) generated by means of password key derivation are generated through KSignCrypto for Java V1.0.1.0, which is a secure validated module.

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

The TSF data encryption key (DEK) that encrypts the TOE set values before the product is installed is generated through the validated module. The key encryption key (KEK) that securely protects the data encryption key (DEK) is also generated through the validated module and password key derivation, and encrypts the data encryption key (DEK) and stores it in a temporary file.

Upon the operation of the product, the temporary file that contains the encryption key encrypted with the key encryption key (KEK) generated through the key derivation based on the password entered by the administrator is decrypted to obtain the TSF data encryption key (DEK), which is then encrypted with the certificate and stored in the policy DB in case of KSignSecureDB Server, and encrypted with the certificate and stored in the shared memory area in the same way as the Server in case of KSignSecureDB DBAgent and KSignSecureDB APIAgent.

The temporary file that contains the encryption key encrypted after being loaded onto the policy DB and the shared memory is deleted.

For the encryption of the TSF data in KSignSecureDB Server, the TSF data encryption key (DEK) encrypted with the certificate stored in the policy DB is obtained and decrypted with the certificate, which then encrypts the TOE set value and store it in the policy DB or in the configuration file.

For the encryption of the TSF data in KSignSecureDB DBAgent or KSignSecureDB APIAgent, the TSF data encryption key (DEK) encrypted with the certificate stored in the shared memory is obtained and decrypted with the certificate, which then encrypts the TOE set value and store it in the configuration file.

The list of the TSF data to be protected and the applied cryptographic algorithms are as follows.

TSF Data	Algorithm and Data	Mandatory Encryption Target
Administrator Password	SHA256(password)	Mandatory Encryption
TOE Config	SEED-CBC(data)	Mandatory Encryption
TSF data encryptionkey	SEED-CBC(key)	Mandatory Encryption
Transmission Data	SEED-CBC(data)	Mandatory Encryption
Transmission Data KEY information	RSAES 2048(key)	Mandatory Encryption
Transmission Data Integrity Value	SHA256(data)	Mandatory Encryption

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

### 6.6.3 Integrity Tests

The integrity verification of the TOE is the function of determining the corruption of the TSF execution data. The authorized administrator performs the integrity verification in the Server. Hash values of the files tested for the integrity verification are generated upon the initial start-up, and SHA-256 is used as the hash algorithm. In case of the integrity verification upon the initial start-up and periodically during the normal operation, the operation stops if the corruption is detected and the audit data on the integrity verification are generated.

The integrity tests are conducted in the following conditions:.

TOE component	Condition of the integrity tests conducted
KSignSecureDB Server	The integrity test is conducted upon the initial start-up and periodically (seven days) during the normal operation
KSignSecureDB DBAgent	The integrity test is conducted upon the initial start-up and periodically (seven days) based on the Server start-up date during the normal operation
KSignSecureDB APIAgent	The integrity test is conducted upon the initial start-up and periodically (seven days) based on the Server start-up date during the normal operation

### 6.6.4 TSF Self Tests

The TSF self tests provide the authorized administrator with the function of self tests to demonstrate that the TSF is operated correctly and verify that the integrity of the TSF data is not compromised. The TOE carries out self tests upon the initial start-up of KSignSecureDB Server, KSignSecureDB DBAgent and KSignSecureDB APIAgent and periodically (interval of seven days) based on the initial start-up date of KSignSecureDB Server during the normal operation in order to demonstrate the correct operation of all TSFs.

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

At each designated interval, the TOE generates hash values for the process test and integrity test items for the purpose of self tests and compare them against the stored hash values (reference values), and incorporate the result of self tests in the validated cryptographic module into the self-test items. In case the integrity violation is detected, the TOE notifies the authorized administrator of the violation and generates the audit data through the security management interface. The TOE carries out the integrity tests on all configuration files and executable files such as the security policy file necessary for the operation of the TOE. The TOE records self test and integrity test results and responses taken by the authorized administrator as audit data.

## 6.6.5 SFR Mapping

SFR to be satisfied: FPT\_PST.1(Extended), FPT\_STM.1, FPT\_ITT.1, FPT\_TEE.1, FPT\_TST.1

## 6.7 TOE Access

### 6.7.1 Administrator Session Restrictions

The TOE limits the maximum number of concurrent sessions that belong to the same administrator to one in accordance with the rule for re-access requests (accessible IP) by the authorized administrator with the same account or the same privilege after the administrator access is made. In addition, the administrator access sessions are permitted in accordance with the allowable IP for the administrator access (up to two IP addresses by default) registered through the security management interface, and access sessions by non-permitted IPs are restricted.

If the top administrator is online, a lower-level administrator is not allowed to access. If the top administrator accesses while a lower-level administrator is online, the access by a lower-level administrator is cancelled. Furthermore, if an access attempt is made with the account which is the same as the top administrator account, the preceding access is cancelled. In case of login with the account or the privilege which is the same as that of a lower-level administrator, the preceding access is cancelled. In addition, the administrator session is terminated after a specified time interval of inactivity. In this case, a lower-level administrator refers to the system administrator, the policy administrator, the encryption administrator and the audit record review administrator, except for the top administrator.

	KSignSecureDB V3.6 Security Target V1.10	Dept	QA팀	Author	Yu Beodeul
		Edit Date	2020-11-13	Version	V1.10
		No.	KSignSecureDB V3.6 Security Target V1.10		

## 6.7.2 Locking the Session in the Security Management Interface

The authorized administrator accesses the TOE security management interface through a web browser on the administrator PC once the TOE is distributed/installed normally. The TOE allows access to the security management interface (HTTPS) only if the administrator trying to make explicitly permitted access completes the identification and authentication process successfully.

After the authorized administrator successfully logs on to the security management interface (web UI) of the TOE and remains inactive for a specified allowable interval, the TOE terminates a session that interacts with the authorized administrator. The default value of the allowable interval of inactivity is set as 10 minutes and cannot be modified. During the session termination, the TOE disables all activities from the existing sessions and terminates the session. If the authorized administrator whose activities have been disabled tries to use the security management interface again, the TOE allows the access to the security management interface by creating a new session only if the re-authentication of the administrator (administrator identification and authentication) is successfully completed. The TOE generates the audit data on the result of such events, that is, the execution result of session locking in the security management interface.

## 6.7.3 SFR Mapping

SFR to be satisfied: FTA\_MCS.2, FTA\_SSL.5(Extended), FTA\_TSE.1
