1 Introduction

This document defines the Security Policy for the Legion of the Bouncy Castle Inc. FIPS Java API (BC-FJA) Module, hereafter denoted the Module. The Module is a cryptographic library. The Module meets FIPS 140-2 overall Level 1 requirements. The SW version is 1.0.0.

The cryptographic module was tested on the following operational environment on the general purpose computer (GPC) platforms detailed in Table 1.

| Operational Environments | | | | | | |
|--------------------------|-------------------------|------------------------------|--------------------------------|--|--|--|
| GPC Platform | <u>CPU</u> Family | <u>OS</u> | Java SE Runtime Environment | | | |
| Cisco | Intel Xeon | Solaris 11 on | Java SE Runtime Environment v7 | | | |
| UCSB-B200-M4 Blade | Processor E5 v3 | vSphere 6 | (1.7.0), single-user mode | | | |
| | | Centos 6.4 on | Java SE Runtime Environment v8 | | | |
| | | vSphere 6 | (1.8.0), single-user mode | | | |
| Simplivity | Intel Xeon | Ubuntu 14.04 | Java SE Runtime Environment v8 | | | |
| OmniCube | Processor E5-2697 v3 | LTS on VMWare ESXi 6.0 | (1.8.0), single-user mode | | | |

Table 1 - Cryptographic Module Tested Environments

As per FIPS 140-2 Implementation Guidance G.5, the cryptographic module will remain compliant with the FIPS 140-2 validation when operating on any general purpose computer (GPC) provided that:

- 1) No source code has been modified.
- 2) The GPC uses the specified single-user platform, or another compatible singleuser platform such as one of the Java SE Runtime Environments listed on any of the following:

HP-UX Linux Centos Linux Debian Linux Oracle RHC Linux Oracle UEK Linux SUSE Linux Ubuntu Mac OS X Microsoft Windows Microsoft Windows Server Microsoft Windows XP RedHat Enterprise Linux Ubuntu on VMWare ESXi running on an Intel Xeon processor

For the avoidance of doubt, it is hereby stated that the CMVP makes no statement as to the correct operation of the module or the security strengths of the generated keys when so ported if the specific operational environment is not listed on the validation certificate.

The Module is intended for use by US Federal agencies and other markets that require a FIPS 140-2 validated Cryptographic Library. The Module is a software-only embodiment; the cryptographic boundary is the Java Archive (JAR) file, *bc-fips-1.0.0.jar*.

The FIPS 140-2 security levels for the Module are given in Table 2 as follows:

| Security Requirement | Security Level |
|--|----------------|
| Cryptographic Module Specification | 1 |
| Cryptographic Module Ports and Interfaces | 1 |
| Roles, Services, and Authentication | 1 |
| Finite State Model | 1 |
| Physical Security | N/A |
| Operational Environment | 1 |
| Cryptographic Key Management | 1 |
| EMI/EMC | 1 |
| Self-Tests | 1 |
| Design Assurance | 1 |
| Mitigation of Other Attacks | 1 |

Table 2 - Security Level of Security Requirements

1.1 Logical and Physical Cryptographic Boundaries

1.1.1 Logical Cryptographic Boundary

The executable for the BC-FJA Module is: *bc-fips-1.0.0.jar*. This module is the only software component within the Logical Cryptographic Boundary and the only software component that carries out cryptographic functions covered by FIPS 140-2. Figure 1 shows the logical relationship of the cryptographic module to the other software and hardware components of the computer. The BC classes are executed on the Java Virtual Machine (JVM) using the classes of the Java Runtime Environment (JRE). The JVM is the interface to the computer's Operating System (OS) that is the interface to the various physical components of the computer.

The physical components of the computer are discussed further in Section 1.1.2. Abbreviations introduced in Figure 1 that describe physical components are: Central Processing Unit (CPU), Dynamic Random Access Memory (DRAM) and Input Output (I/O).

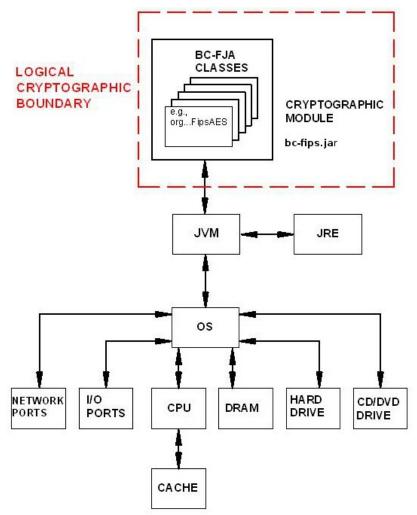

Figure 1 - Block Diagram of the Software for the BC-FJA Module.

1.1.2 Physical Boundary

The BC-FJA Module runs on a General Purpose Computer (GPC). The Physical Cryptographic Boundary for the module is the case of that computer. Figure 2 shows a

Copyright Legion of the Bouncy Castle Inc. 2016 Version 1.0.0l Page 6 of 31 Public Material – May be reproduced only in its original entirety (without revision). block diagram of the physical components of a typical GPC and the ports or interfaces across the Physical Cryptographic Boundary. All the physical components are standard electronic components; there are not any custom integrated circuits or components dedicated to FIPS 140-2 related functions.

Abbreviations introduced in Figure 2 are: Basic I/O System (BIOS), Integrated Device Electronics (IDE), Institute of Electrical and Electronic Engineers (IEEE), Instruction Set Architecture (ISA), Peripheral Component Interconnect (PCI), Universal Asynchronous Receiver/Transmitter (UART) and Universal Serial Bus (USB). Input or output ports are designated by arrows with single heads, while I/O ports are indicated by bidirectional arrows.

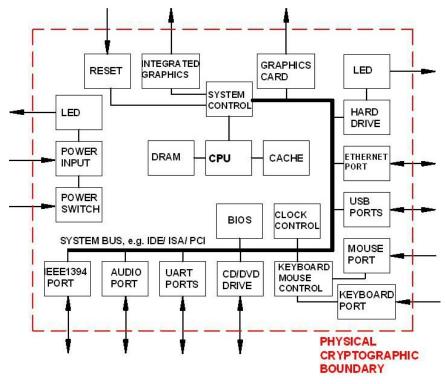

Figure 2 - Block Diagram of the Physical Components of a typical GPC.

For FIPS 140-2 purposes, the BC-FJA Module is defined as a "multi-chip standalone module", therefore, the module's physical ports or interfaces are defined as those for the hardware of the GPC. These physical ports are separated into the logical interfaces defined by FIPS 140-2, as shown in Table 3.

The BC-FJA Module is a software module only, and, therefore, control of the physical ports is outside of the module's scope. The module does provides a set of logical interfaces which are mapped to the following FIPS 140-2 defined logical interfaces: data input, data output, control input, status output, and power. When the module performs self-tests, is in an error state, is generating keys, or performing zeroization, the module prevents all output on the logical data output interface as only the thread performing the operation has access to the data. The module is single-threaded, and in an error state, the module does not return any output data, only an error value.

The mapping of the FIPS 140-2 logical interfaces to the module is described in table 3.

Table 3 - FIPS 140-2 Logical Interfaces

| Interface | Module Equivalent |
|---------------|--|
| Data Input | API input parameters – plaintext and/or ciphertext data. |
| Data Output | API output parameters and return values – plaintext and/or ciphertext data. |
| Control Input | API method calls - method calls, or input parameters, that specify commands and/or control data used to control the operation of the module. |
| Status Output | API output parameters and return/error codes that provide status information used to indicate the state of the module. |
| Power | Start up/Shutdown of a process containing the module. |

1.2 Modes of Operation

There will be two modes of operation: Approved and Non-approved. The module will be in FIPS-approved mode when the appropriate factory is called. To verify that a module is in the Approved Mode of operation, the user can call a FIPS-approved mode status method (CryptoServicesRegisrar.isInApprovedOnlyMode()). If the module is configured non-approved to allow approved and mode operation. а call to CryptoServicesRegistrar.setApprovedMode(true) will switch the current thread of user control into approved mode.

In FIPS-approved mode, the module will not provide non-approved algorithms, therefore, exceptions will be called if the user tries to access non-approved algorithms in the Approved Mode.

1.3 Module Configuration

In default operation the module will start with both approved and non-approved mode enabled.

If the underlying JVM is running with a Java Security Manager installed the module will be running in approved mode with secret and private key export disabled.

Use of the module with a Java Security manager requires the setting of some basic permissions to allow the module HMAC-SHA-256 software integrity test to take place as well as to allow the module itself to examine secret and private keys. The basic permissions required for the module to operate correctly with a Java Security manager are indicated by a Y in the **Req** column of Table 4.

| Permission | Settings | Req | Usage |
|-------------------|-------------------------|-----|--|
| RuntimePermission | "getProtectionDomain" | Y | Allows checksum to be carried out on jar. |
| RuntimePermission | "accessDeclaredMembers" | Y | Allows use of reflection API within the provider. |

Table 4 - Available Java Permissions

Copyright Legion of the Bouncy Castle Inc. 2016 Version 1.0.0l Page 8 of 31 Public Material – May be reproduced only in its original entirety (without revision).

| PropertyPermission | <pre>"java.runtime.name", "read"</pre> | N | Only if configuration properties are used. |
|--------------------------|--|---|---|
| SecurityPermission | "putProviderProperty.BCFIPS" | N | Only if provider installed during execution. |
| CryptoServicesPermission | "unapprovedModeEnabled" | N | Only if unapproved mode algorithms required. |
| CryptoServicesPermission | "changeToApprovedModeEnabled" | N | Only if threads allowed to change modes. |
| CryptoServicesPermission | "exportSecretKey" | N | To allow export of secret keys only. |
| CryptoServicesPermission | <pre>"exportPrivateKey"</pre> | N | To allow export of private keys only. |
| CryptoServicesPermission | "exportKeys" | Y | Required to be applied for the module itself. Optional for any other codebase. |
| CryptoServicesPermission | "tlsNullDigestEnabled" | N | Only required for TLS digest calculations. |
| CryptoServicesPermission | "tlsPKCS15KeyWrapEnabled" | N | Only required if TLS is used with RSA encryption. |
| CryptoServicesPermission | "tlsAlgorithmsEnabled" | N | Enables both NullDigest and PKCS15KeyWrap. |
| CryptoServicesPermission | "defaultRandomConfig" | N | Allows setting of default SecureRandom. |
| CryptoServicesPermission | "threadLocalConfig" | N | Required to set a thread local property in the CryptoServicesRegistrar |
| CryptoServicesPermission | "globalConfig" | N | Required to set a global property in the CryptoServicesRegistrar. |

2 Cryptographic Functionality

The Module implements the FIPS Approved and Non-Approved but Allowed cryptographic functions listed in Table 5 to Table 7, below.

| Algorithm | Description | Cert # |
|-----------------------------|---|-----------------------------|
| AES | [FIPS 197, SP 800-38A] | <u>3756</u> |
| | Functions: Encryption, Decryption | |
| | Modes: ECB, CBC, OFB, CFB8, CFB128, CTR | |
| | Key sizes: 128, 192, 256 bits | |
| AES-CBC | [Addendum to SP 800-38A, Oct 2010] | Based on |
| Ciphertext Stealing (CS) | Functions: Encryption, Decryption | <u>3756</u> |
| | Modes: CBC-CS1, CBC-CS2, CBC-CS3 | |
| | Key sizes: 128, 192, 256 bits | |
| ССМ | [SP 800-38C] | <u>3756</u> |
| | Functions: Generation, Authentication | |
| | Key sizes: 128, 192, 256 bits | |
| СМАС | [SP 800-38B] | <u>3756 (AES)</u> , |
| | Functions: Generation, Authentication | <u>2090</u> (Triple-DES) |
| | Key sizes: AES with 128, 192, 256 bits and Triple-DES with 2-key ^{1,2} , 3-key | <u>,p.c 2207</u> |
| GCM/GMAC ³ | [SP 800-38D] | <u>3756</u> |
| | Functions: Generation, Authentication | |
| | Key sizes: 128, 192, 256 bits | |
| DRBG | [SP 800-90A] | <u>1031</u> |
| | Functions: Hash DRBG, HMAC DRBG, CTR DRBG | |
| | Security Strengths: 112, 128, 192, and 256 bits | |

Table 5 - Approved and CAVP Validated Cryptographic Functions

¹ 2^20 block limit is enforced by module

 $^{^2}$ In approved mode of operation, the use of 2-key Triple-DES to generate MACs for anything other than verification purposes is non-compliant.

³ GCM with an internally generated IV, see section 8.3 concerning external IVs. IV generation is compliant with IG A.5.

| Algorithm | Description | Cert # |
|---|---|-------------------|
| DSA ⁴ | [FIPS 186-4] | <u>1043</u> |
| | Functions: PQG Generation, PQG Verification, Key Pair Generation, Signature Generation, Signature Verification | |
| | Key sizes: 1024, 2048, 3072 bits (1024 only for SigVer) | |
| ECDSA | [FIPS 186-4] | <u>804</u> , |
| | Functions: Signature Generation Component, Public Key Generation, Signature Generation, Signature Verification, Public Key Validation | <u>705 (CVL)</u> |
| | Curves/Key sizes: P-192*, P-224, P-256, P-384, P-521, K-163*, K-233, K-283, K-409, K-571, B-163*, B-233, B- 283, B-409, B-571 | |
| | * Curves only used for Signature Verification and Public Key Validation | |
| НМАС | [FIPS 198-1] | <u>2458</u> |
| | Functions: Generation, Authentication | |
| | SHA sizes: SHA-1, SHA-224, SHA-256, SHA-384, SHA- 512, SHA-512/224, SHA-512/256 | |
| KAS⁵ | [SP 800-56A-rev2] | <u>73</u> |
| | Parameter sets/Key sizes: FB, FC, EB, EC, ED, EE | |
| KDF, Existing | [SP 800-135] | <u>704 (CVL)</u> |
| Application- Specific ⁶ | Functions: TLS v1.0/1.1 KDF, TLS 1.2 KDF, SSH KDF, X9.63 KDF, IKEv2 KDF, SRTP KDF. | |
| KBKDF, using | [SP 800-108] | <u>78</u> |
| Pseudorando m Functions ⁷ | Modes: Counter Mode, Feedback Mode, Double- Pipeline Iteration Mode | |
| | Functions: CMAC-based KBKDF with AES, 2-key Triple- DES, 3-key Triple-DES or HMAC-based KBKDF with SHA- 1, SHA-224, SHA-256, SHA-384, SHA-512 | |
| Key Wrapping | [SP 800-38F] | <u>3756 (AES)</u> |
| Using Block Ciphers ⁸ | Modes: AES KW, KWP | |
| | Key sizes: 128, 192, 256 bits (provides between 128 and 256 bits of strength) | |

⁴ DSA signature generation with SHA-1 is only for use with protocols.

⁵ Keys are not established directly into the module using the key agreement algorithms.

⁶ These protocols have not been reviewed or tested by the CAVP and CMVP.

⁷ Note: CAVP testing is not provided for use of the PRFs SHA-512/224 and SHA-512/256. These must not be used in approved mode.

⁸ Keys are not established directly into the module using key unwrapping. Copyright Legion of the Bouncy Castle Inc. 2016 Version 1.0.0l Page 11 of 31 Public Material – May be reproduced only in its original entirety (without revision).

| Algorithm | Description | Cert # |
|--|---|---|
| | [SP 800-38F] | 2090 |
| | Mode: Triple-DES TKW | (Triple-DES) |
| | Key size: 3-key (provides 112 bits of strength) | |
| RSA | [FIPS 186-4, FIPS 186-2, ANSI X9.31-1998 and PKCS #1 v2.1 (PSS and PKCS1.5)] | <u>1932</u> , 706 (CVL) |
| | Functions: Key Pair Generation, Signature Generation, Signature Verification, Component Test | <u>· · · · · · · · · · · · · · · · · · · </u> |
| | Key sizes: 2048, 3072 bits (1024, 1536, 4096 only for SigVer) | |
| SHA | [FIPS 180-4], | <u>3126</u> |
| | Functions: Digital Signature Generation, Digital Signature Verification, non-Digital Signature Applications | |

2.1 Critical Security Parameters

All CSPs used by the Module are described in this section in Table 9. All usage of these CSPs by the Module (including all CSP lifecycle states) is described in the services detailed in Section 3.2.

Table 9 - Critical Security Parameters (CSPs)

| CSP | Description / Usage |
|---------------------------|--|
| AES Encryption Key | [FIPS-197, SP 800-56C, SP 800-38D, Addendum to SP 800- 38A] AES (128/192/256) encrypt key ¹⁹ |
| AES Decryption Key | [FIPS-197, SP 800-56C, SP 800-38D, Addendum to SP 800- 38A] AES (128/192/256) decrypt key |
| AES Authentication Key | [FIPS-197] AES (128/192/256) CMAC/GMAC key |

¹⁵ Deterministic signature calculation, support for additional digests, and key sizes.

¹⁶ Support for additional digests and signature formats, PKCS#1 1.5 key wrapping, support for additional key sizes.

¹⁷ Support for additional key sizes and the establishment of keys of less than 112 bits of security strength.

¹⁸ Support for additional modes of operation.

¹⁹ The AES-GCM key and IV is generated randomly per IG A.5, and the Initialization Vector (IV) is a minimum of 96 bits. In the event module power is lost and restored, the consuming application must ensure that any of its AES-GCM keys used for encryption or decryption are re-distributed.

| CSP | Description / Usage |
|---|--|
| AES Wrapping Key | [SP 800-38F] AES (128/192/256) key wrapping key |
| DH Agreement key | [SP 800-56A-rev2] Diffie-Hellman (>= 2048) private key agreement key |
| DRBG(CTR AES) | V (128 bits) and AES key (128/192/256), entropy input (length dependent on security strength) |
| DRBG(CTR Triple- DES) | V (64 bits) and Triple-DES key (192), entropy input (length dependent on security strength) |
| DRBG(Hash) | V (440/888 bits) and C (440/888 bits), entropy input (length dependent on security strength) |
| DRBG(HMAC) | V (160/224/256/384/512 bits) and Key (160/224/256/384/512 bits), entropy input (length dependent on security strength) |
| DSA Signing Key | [FIPS 186-4] DSA (2048/3072) signature generation key |
| EC Agreement Key | [SP 800-56A-rev2] EC (All NIST defined B, K, and P curves $>= 224$ bits) private key agreement key |
| EC Signing Key | [FIPS 186-4] ECDSA (All NIST defined B, K, and P curves \geq 224 bits) signature generation key. |
| HMAC Authentication Key | [FIPS 198-1] Keyed-Hash key (SHA-1, SHA-2). Key size determined by security strength required ($>=$ 112 bits) |
| IKEv2 Derivation Function Secret Value | [SP 800-135] Secret value used in construction of key for the specified IKEv2 PRF. |
| PBKDF Secret Value | [SP 800-132] Secret value used in construction of Keyed-Hash key for the specified PRF. |
| RSA Signing Key | [FIPS 186-4] RSA (>= 2048) signature generation key |
| RSA Key Transport Key | [SP 800-56B] RSA (>=2048) key transport (decryption) key |
| SP 800-56A-rev2 Concatenation Derivation Function | [SP 800-56A-rev2] Secret value used in construction of key for underlying PRF. |
| SP 800-108 KDF Secret Value | [SP 800-108] Secret value used in construction of key for the specified PRF. |
| SRTP Derivation Function Secret Value | [SP 800-135] Secret value used in construction of key for the specified SRTP PRF. |
| SSH Derivation Function Secret Value | [SP 800-135] Secret value used in construction of key for the specified SSH PRF. |
| TLS KDF Secret Value | [SP 800-135] Secret value used in construction of Keyed-Hash key for the specified TLS PRF. |
| Triple-DES | [SP 800-67] Triple-DES (128/192) CMAC key |

| CSP | Description / Usage |
|------------------------------|---|
| Authentication Key | |
| Triple-DES Encryption Key | [SP 800-67] Triple-DES (192) encryption key |
| Triple-DES Decryption Key | [SP 800-67] Triple-DES (128/192) decryption key |
| Triple-DES Wrapping Key | [SP 800-38F] Triple-DES (192 bits) key wrapping/unwrapping key, (128 unwrapping only). |
| X9.63 KDF Secret Value | [SP 800-135] Secret value used in construction of Keyed-Hash key for the specified X9.63 PRF. |

2.2 Public Keys

Table 10 - Public Keys

| CSP | Description / Usage | | | | | |
|--------------------------|---|--|--|--|--|--|
| DH Agreement Key | [SP 800-56A-rev2] Diffie-Hellman (>= 2048) public key agreement key | | | | | |
| DSA Verification Key | [FIPS 186-4] DSA (1024/2048/3072) signature verification key | | | | | |
| EC Agreement Key | [SP 800-56A-rev2] EC (All NIST defined B, K, and P curves) public key agreement key | | | | | |
| EC Verification Key | [FIPS 186-4] ECDSA (All NIST defined B, K, and P curves) signature verification key | | | | | |
| RSA Key Transport Key | [SP 800-56B] RSA (>=2048) key transport (encryption) key. | | | | | |
| RSA Verification Key | [FIPS 186-4] RSA (>= 1024) signature verification key | | | | | |

3 Roles, Authentication and Services

3.1 Assumption of Roles

The module supports two distinct operator roles, User and Cryptographic Officer (CO). The cryptographic module implicitly maps the two roles to the services. A user is considered the owner of the thread that instantiates the module and, therefore, only one concurrent user is allowed.

Table 11 lists all operator roles supported by the module. The module does not support a maintenance role and/or bypass capability. The module does not support authentication.

| Role ID | Role Description | Authentication Type |
|------------|---|--|
| СО | Cryptographic Officer – Powers on and off the module. | N/A – Authentication not required for Level 1 |
| User | User – The user of the complete API. | N/A – Authentication not required for Level 1 |

Table 11 - Roles Description

3.2 Services

All services implemented by the Module are listed in Table 12 below and Table 13 describes all usage of CSPs by the service.

Table 12 lists the services. The second column provides a description of each service and availability to the Cryptographic Officer and User, in columns 3 and 4, respectively.

| Service | Description | | | |
|--|---|---|---|--|
| Initialize Module and Run Self-Tests on Demand | The JRE will call the static constructor for self-tests on module initialization. | х | | |
| Show Status | A user can call <i>FipsStatus.IsReady()</i> at any time to determine if the module is ready. | | x | |
| | CryptoServicesRegistrar. <i>IsInApprovedOnlyMode()</i> can be called to determine the FIPS mode of operation. | | | |
| Zeroize / Power-off | The module uses the JVM garbage collector on thread termination. | | х | |
| Data Encryption | Used to encrypt data. | | Х | |
| Data Decryption | Used to decrypt data. | | Х | |
| MAC Calculation | Used to calculate data integrity codes with CMAC. | | Х | |

Table 12 - Services

| Service | Description | | | | | Description | | | |
|---|---|--|---|--|--|-------------|--|--|--|
| Signature Authentication | Used to generate signatures (DSA, ECDSA, RSA). | | | | | | | | |
| Signature Verification | Used to verify digital signatures. | | | | | | | | |
| DRBG (SP800-90A) output | Used for random number, IV and key generation. | | х | | | | | | |
| Message Hashing | Used to generate a SHA-1, SHA-2, or SHA-3 message digest, SHAKE output. | | х | | | | | | |
| Keyed Message Hashing | Used to calculate data integrity codes with HMAC. | | х | | | | | | |
| TLS Key Derivation Function | (secret input) (outputs secret) Used to calculate a value suitable to be used for a master secret in TLS from a pre-master secret and additional input. | | x | | | | | | |
| SP 800-108 KDF | (secret input) (outputs secret) Used to calculate a value suitable to be used for a secret key from an input secret and additional input. | | x | | | | | | |
| SSH Derivation Function | (secret input) (outputs secret) Used to calculate a value suitable to be used for a secret key from an input secret and additional input. | | x | | | | | | |
| X9.63 Derivation Function | (secret input) (outputs secret) Used to calculate value suitable to be used for a secret key from a input secret and additional input. | | x | | | | | | |
| SP 800-56A-rev2 Concatenation Derivation Function | (secret input) (outputs secret) Used to calculate a value suitable to be used for a secret key from an input secret and additional input. | | x | | | | | | |
| IKEv2 Derivation Function | (secret input) (outputs secret) Used to calculate a value suitable to be used for a secret key from an input secret and additional input. | | x | | | | | | |
| SRTP Derivation Function | (secret input) (outputs secret) Used to calculate a value suitable to be used for a secret key from an input secret and additional input. | | x | | | | | | |
| PBKDF | (secret input) (outputs secret) Used to generate a key using an encoding of a password and an additional function such as a message hash. | | x | | | | | | |
| Key Agreement Schemes | Used to calculate key agreement values (SP 800-56A, Diffie-Hellman). | | x | | | | | | |
| Key Wrapping | Used to encrypt a key value. (RSA, AES, Triple-DES) | | Х | | | | | | |
| Key Unwrapping | Used to decrypt a key value. (RSA, AES, Triple-DES) | | Х | | | | | | |
| NDRNG Callback | Gathers entropy in a passive manner from a user- provided function | | x | | | | | | |
| Utility | Miscellaneous utility functions, does not access CSPs | | X | | | | | | |

Copyright Legion of the Bouncy Castle Inc. 2016 Version 1.0.0l Page 18 of 31 Public Material – May be reproduced only in its original entirety (without revision). Note: The module services are the same in the approved and non-approved modes of operation. The only difference is the function(s) used (approved/allowed or non-approved/non-allowed).

Services in the module are accessed via the public APIs of the Jar file. The ability of a thread to invoke non-approved services depends on whether it has been registered with the module as approved mode only. In approved only mode no non-approved services are accessible. In the presence of a Java SecurityManager approved mode services specific to a context, such as DSA and ECDSA for use in TLS, require specific permissions to be configured in the JVM configuration by the Cryptographic Officer or User.

In the absence of a Java SecurityManager specific services related to protocols such as TLS are available, however must only be used in relation to those protocols.

Table 13 defines the relationship between access to CSPs and the different module services. The modes of access shown in the table are defined as:

- G = Generate: The module generates the CSP.
- R = Read: The module reads the CSP. The read access is typically performed before the module uses the CSP.
- E = Execute: The module executes using the CSP.
- W = Write: The module writes the CSP. The write access is typically performed after a CSP is imported into the module, when the module generates a CSP, or when the module overwrites an existing CSP.
- Z = Zeroize: The module zeroizes the CSP.

| | CSPs | | | | | | | | | |
|---|----------|---------|-----------|----------|------------------|-----------|-----------|-------------------|----------|-----------------|
| Service | AES Keys | DH Keys | DRBG Keys | DSA Keys | EC Agreement Key | ECDSA Key | HMAC Keys | KDF Secret Values | RSA Keys | Triple-DES Keys |

4 Self-tests

Each time the module is powered up, it tests that the cryptographic algorithms still operate correctly and that sensitive data have not been damaged. Power-up self-tests are available on demand by power cycling the module.

On power-up or reset, the module performs the self-tests that are described in Table 14 below. All KATs must be completed successfully prior to any other use of cryptography by the Module. If one of the KATs fails, the module enters the Self-Test Failure error state. The module will output a detailed error message when *FipsStatus.isReady()* is called. The error state can only be cleared by reloading the module and calling *FipsStatus.isReady()* again to confirm successful completion of the KATs.

| Test Target | Description |
|-----------------------|---|
| Software Integrity | HMAC-SHA256 |
| AES | KATs: Encryption, Decryption Modes: ECB Key sizes: 128 bits |
| CCM | KATs: Generation, Verification Key sizes: 128 bits |
| AES-CMAC | KATs: Generation, Verification Key sizes: AES with 128 bits |
| FFC KAS | KATs: Per IG 9.6 – Primitive "Z" Computation Parameter Sets/Key sizes: FB |
| DRBG | KATs: HASH_DRBG, HMAC_DRBG, CTR_DRBG Security Strengths: 256 bits |
| DSA | KAT: Signature Generation, Signature Verification Key sizes: 2048 bits |
| ECDSA | KAT: Signature Generation, Signature Verification Curves/Key sizes: P-256 |
| GCM/GMAC | KATs: Generation, Verification Key sizes: 128 bits |
| НМАС | KATs: Generation, Verification SHA sizes: SHA-1, SHA-224, SHA-256, SHA-384, SHA-512, SHA- 512/224, SHA-512/256 |
| ECC KAS | KATs: Per IG 9.6 – Primitive "Z" Computation Parameter Sets/Key sizes: FB |
| RSA | KATs: Signature Generation, Signature Verification Key sizes: 2048 bits |
| SHS | KATs: Output Verification SHA sizes: SHA-1, SHA-224, SHA-256, SHA-384, SHA-512, SHA- 512/224, SHA-512/256, SHA3-224, SHA3-256, SHA3-384, SHA3-512 |
| Triple-DES | KATs: Encryption, Decryption Mode: TECB Key sizes: 3-Key |
| Triple-DES- CMAC | KATs: Generation, Verification Key sizes: 3-Key |
| Extendable- Output | KATs: Output Verification XOFs:SHAKE128, SHAKE256 |

Table 14 - Power Up Self-tests

Copyright Legion of the Bouncy Castle Inc. 2016 Version 1.0.0l Page 21 of 31 Public Material – May be reproduced only in its original entirety (without revision).

| Test Target | Description |
|-----------------|---|
| functions (XOF) | |
| Key Wrapping | KATs: SP 800-56B specific KATs per IG D.4 |
| Using RSA | Key sizes: 2048 bits |
| Key Transport | KATs: SP 800-56B specific KATs per IG D.4 |
| Using RSA | Key sizes: 2048 bits |

Table 15 - Conditional Self-tests

| Test Target | Description |
|--------------------------|--|
| NDRNG | NDRNG Continuous Test performed when a random value is requested from the NDRNG. |
| DH | DH Pairwise Consistency Test performed on every DH key pair generation. |
| DRBG | DRBG Continuous Test performed when a random value is requested from the DRBG. |
| DSA | DSA Pairwise Consistency Test performed on every DSA key pair generation. |
| ECDSA | ECDSA Pairwise Consistency Test performed on every EC key pair generation. |
| RSA | RSA Pairwise Consistency Test performed on every RSA key pair generation. |
| DRBG Health Checks | Performed conditionally on DRBG, per SP 800-90A Section 11.3. Required per IG C.1. |
| SP 800-56A Assurances | Performed conditionally per SP 800-56A Sections 5.5.2, 5.6.2, and/or 5.6.3. Required per IG 9.6. |

5 Physical Security Policy The module is a software-only module and does not have physical security mechanisms.

6 Operational Environment

The module operates in a modifiable operational environment under the FIPS 140-2 definitions.

The module runs on a GPC running one of the operating systems specified in the approved operational environment list. Each approved operating system manages processes and threads in a logically separated manner. The Module's user is considered the owner of the calling application that instantiates the Module within the process space of the Java Virtual Machine.

The module optionally uses the Java Security Manager, and starts in FIPS-approved mode by default when used with the Java Security Manager. When the module is not used within the context of the Java Security Manager, it will start by default in the non-FIPS-approved mode.

6.1 Use of External RNG

The module makes use of the JVM's configured SecureRandom entropy source to provide entropy when required. The module will request entropy as appropriate to the security strength and seeding configuration for the DRBG that is using it. In approved mode the minimum amount of entropy that would be requested is 112 bits with a larger minimum being set if the security strength of the operation requires it.. The module will wait until the *SecureRandom.generateSeed()* returns the requested amount of entropy, blocking if necessary.

7 Mitigation of Other Attacks Policy

The Module implements basic protections to mitigate against timing based attacks against its internal implementations. There are two counter-measures used.

The first is Constant Time Comparisons, which protect the digest and integrity algorithms by strictly avoiding "fast fail" comparison of MACs, signatures, and digests so the time taken to compare a MAC, signature, or digest is constant regardless of whether the comparison passes or fails.

The second is made up of Numeric Blinding and decryption/signing verification which both protect the RSA algorithm.

Numeric Blinding prevents timing attacks against RSA decryption and signing by providing a random input into the operation which is subsequently eliminated when the result is produced. The random input makes it impossible for a third party observing the private key operation to attempt a timing attack on the operation as they do not have knowledge of the random input and consequently the time taken for the operation tells them nothing about the private value of the RSA key.

Decryption/signing verification is carried out by calculating a primitive encryption or signature verification operation after a corresponding decryption or signing operation before the result of the decryption or signing operation is returned. The purpose of this is to protect against Lenstra's CRT attack by verifying the correctness the private key calculations involved. Lenstra's CRT attack takes advantage of undetected errors in the use of RSA private keys with CRT values and, if exploitable, can be used to discover the private value of the RSA key.

8 Security Rules and Guidance

8.1 Basic Enforcement

The module design corresponds to the Module security rules. This section documents the security rules enforced by the cryptographic module to implement the security requirements of this FIPS 140-2 Level 1 module.

- 1. The module shall provide two distinct operator roles: User and Cryptographic Officer.
- 2. The module does not provide authentication.
- 3. The operator shall be capable of commanding the module to perform the power up self-tests by cycling power or resetting the module.
- 4. Power up self-tests do not require any operator action.
- 5. Data output shall be inhibited during key generation, self-tests, zeroization, and error states.
- 6. Status information does not contain CSPs or sensitive data that if misused could lead to a compromise of the module.
- 7. There are no restrictions on which keys or CSPs are zeroized by the zeroization service.
- 8. The module does not support concurrent operators.
- 9. The module does not have any external input/output devices used for entry/output of data.
- 10. The module does not enter or output plaintext CSPs from the module's physical boundary.
- 11. The module does not output intermediate key values.

8.2 Additional Enforcement with a Java SecurityManager

In the presence of a Java SecurityManager approved mode services specific to a context, such as DSA and ECDSA for use in TLS, require specific policy permissions to be configured in the JVM configuration by the Cryptographic Officer or User. The SecurityManager can also be used to restrict the ability of particular code bases to examine CSPs. See section 1.3 for further advice on this.

In the absence of a Java SecurityManager specific services related to protocols such as TLS are available, however must only be used in relation to those protocols.

8.3 Basic Guidance

The jar file representing the module needs to be installed in a JVM's class path in a manner appropriate to its use in applications running on the JVM.

Functionality in the module is provided in two ways. At the lowest level there are distinct classes that provide access to the FIPS approved and non-FIPS approved services provided by the module. A more abstract level of access can also be gained through the use of strings providing operation names passed into the module's Java cryptography provider through the APIs described in the Java Cryptography Architecture (JCA) and the Java Cryptography Extension (JCE).

When the module is being used in FIPS approved-only mode, classes providing implementations of algorithms which are not FIPS approved, or allowed, are explicitly disabled.

8.4 Enforcement and Guidance for GCM IVs

 IVs for GCM can be generated randomly, where an IV is not generated randomly the module supports the importing of GCM $\mathsf{IVs}.$

In approved mode, when a GCM IV is generated randomly, the module enforces the use of an approved DRGB in line with Section 8.2.2 of SP 800-38D.

In approved mode, importing a GCM IV for encryption is non-conformant.

Per IG A.5, section 2.1 of this security policy also states that in the event module power is lost and restored the consuming application must ensure that any of its AES-GCM keys used for encryption or decryption are re-distributed.

8.5 Enforcement and Guidance for use of the Approved PBKDF

In line with the requirements for SP 800-132, keys generated using the approved PBKDF must only be used for storage applications. Any other use of the approved PBKDF is non-conformant.

In approved mode the module enforces that any password used must encode to at least 14 bytes (112 bits) and that the salt is at least 16 bytes (128 bits) long. The iteration count associated with the PBKDF should be as large as practical.

As the module is a general purpose software module, it is not possible to anticipate all the levels of use for the PBKDF, however a user of the module should also note that a password should at least contain enough entropy to be unguessable and also contain enough entropy to reflect the security strength required for the key being generated. In the event a password encoding is simply based on ASCII a 14 byte password is unlikely to contain sufficient entropy for most purposes. Users are referred to Appendix A, "Security Considerations" of SP 800-132 for further information on password, salt, and iteration count selection.
