1 Introduction

The SonicWALL SMA Series v12.1, also referred to as "the Module", are multi-chip standalone cryptographic modules enclosed in hard, commercial grade metal cases. The cryptographic boundary for these modules is the enclosure; however the removable fans of the SMA 7200 and SMA 6200 and the removable power supplies of the EX-9000 and SMA-7200 are outside the cryptographic boundary. The primary purpose of these modules is to provide secure remote access to internal resources via the Internet Protocol (IP). The modules provide network interfaces for data input and output. The appliance encryption technology uses FIPS approved algorithms. FIPS approved algorithms are approved by the U.S. government for protecting Unclassified data.

The Module is designated as a limited operational environment under the FIPS 140-2 definitions. The Module includes a firmware load service to support necessary updates.
New firmware versions within the scope of this validation must be validated to FIPS 140-2 through the CMVP. Any other firmware loaded into this module is out of the scope of this validation and require a separate FIPS 140-2 validation.

	Module	HW P/N and Version	FW Version
1	EX-9000	101-500352-62 Rev A	12.1.0-04493
2	SMA 6200	101-500399-61 Rev B	12.1.0-04493
3	SMA 7200	101-500398-61 Rev B	12.1.0-04493

Table 1 – Cryptographic Module Configurations

The FIPS 140-2 security levels for the module are as follows:

Security Requirement	Security Level
Cryptographic Module Specification	2
Cryptographic Module Ports and Interfaces	2
Roles, Services, and Authentication	2
Finite State Model	2
Physical Security	2
Operational Environment	N/A
Cryptographic Key Management	2
EMI/EMC	2
Self-Tests	2
Design Assurance	2
Mitigation of Other Attacks	N/A

Table 2 – Security Level of Security Requirements

1.1 Hardware

The physical forms of each configuration of the module are depicted in Figure 1.

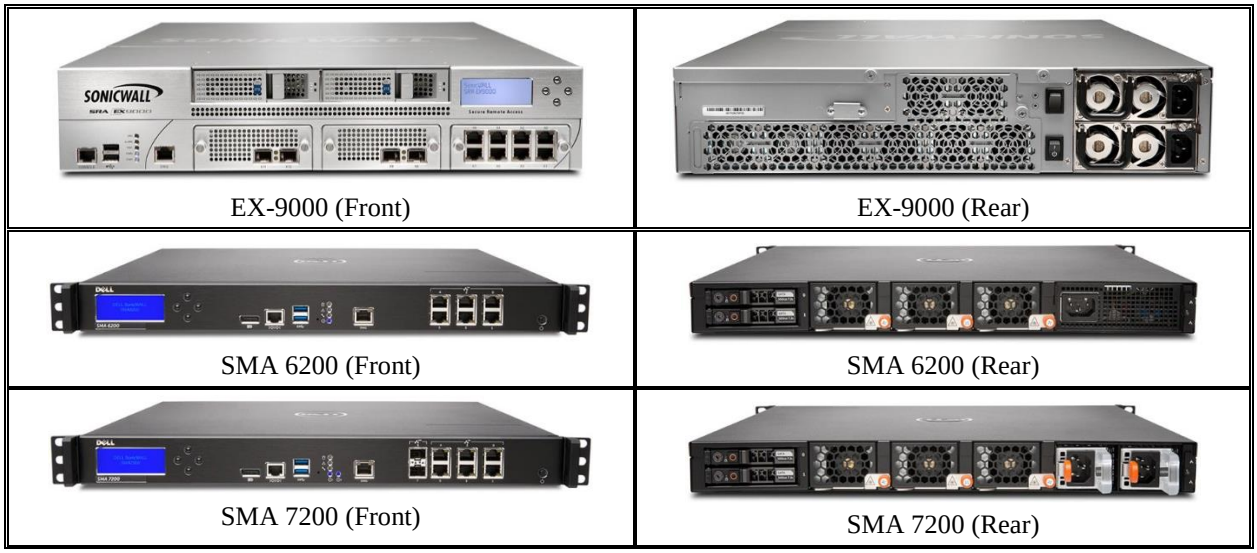

Figure 1 – Physical form of all Module configurations

Port	Description	Logical Interface Type
Console	Serial (all configurations) and DisplayPort (SMA 6200/7200 only) command line interface	Control in, Status out
DIAG	Ethernet port for manufacturing: EX-9000, SMA 6200 and SMA 7200.	N/A: Used only during manufacturing process; disabled prior to product delivery.
eSATA	Disk interface.	N/A: Not used in approved mode. The hardware platform design is common with other configurations that use this port.
Ethernet	Network traffic connections. SMA 6200: 6 ports SMA 7200: 8 ports EX-9000: 12 ports	Control in, Data in, Data out, Status out
Display buttons	Four (4) buttons used to navigate LCD displays.	Control in
Display	LCD display for basic status information.	Status out
LEDs	Unit level: Disk Activity, Test, Alarm and Power (1 or 2 LEDs). Ethernet: Link and Activity LEDs.	Status out
Power	AC power, inclusive of switch. EX-9000 and SMA 7200 have dual (redundant) power supplies.	Power
USB	Two (2) USB ports, used for disaster recovery only.	N/A: Not for use in approved mode

Table 3 – Ports and Interfaces

1.2 Modes of Operation

The module's Management Console provides the mechanism to configure the module for the Approved mode of operation, found in *General Settings* > *Configure FIPS Security*. Attempts to check the *Enable FIPS mode* checkbox execute a FIPS Approved mode compliance checking tool, which enforces the use of only the FIPS Approved mode ciphers listed in Table 4 below, and provides clearly visible warnings if any of the following configuration conditions are not met:

- The following authentication servers may be used, if connected using only FIPS approved ciphers:
  - LDAP
  - Active Directory single domain
  - RSA Authentication Manager
- Use of RADIUS authentication servers is not permitted in the Approved mode.
- Clustering (High Availability) is not supported in FIPS mode.
- Configured connections with SonicWALL GMS or Viewpoint servers are not permitted in the Approved mode.

In the non-Approved mode, the features cited in the bullets above are available for use. See Section 8, *Security Rules and Guidance* for additional Approved mode operation guidance.

2 Cryptographic Functionality

The cryptographic protocols and primitves implemented and used by the modules are listed in this section. Table 4 lists the TLS ciphersuites, all of which are the same in both the Approved and non-Approved modes. Table 5 lists the SSH security methods; unlike TLS ciphersuites, SSH methods are independently selectable and may be used in any combination.

Cipher Suite String (IETF enumeration)	TLS	Key Exchange	Cipher	Auth
TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256[1]	1.2	ECDH_P384	AES-128	GCM
TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384	1.2	ECDH_P384	AES-256	GCM
TLS_RSA_WITH_3DES_EDE_CBC_SHA	1.2, 1.1, 1.0	RSA	Triple-DES[2]	SHA-1
TLS_RSA_WITH_AES_128_CBC_SHA	1.2, 1.1, 1.0	RSA	AES-128	SHA-1
TLS_RSA_WITH_AES_128_CBC_SHA256	1.2	RSA	AES-128	SHA-256
TLS_RSA_WITH_AES_256_CBC_SHA	1.2, 1.1, 1.0	RSA	AES-256	SHA-1
TLS_RSA_WITH_AES_256_CBC_SHA256	1.2	RSA	AES-256	SHA-256

Table 4 – Management Console and VPN session TLS Ciphersuites used in the Approved and non-Approved modes

[1] These GCM ciphersuites are from SP 800-52 Rev 1, Section 3.3.1

[2] The operator shall ensure no more than 2^{32} encryption operations are done with the same Triple-DES key

Key Exchange	Mode
ecdh-sha2-nistp256	Approved and Non-Approved
ecdh-sha2-nistp384	Approved and Non-Approved
Server Host Key (Authentication)	
ecdsa-sha2-nistp384	Approved and Non-Approved
ssh-rsa	Approved and Non-Approved
Digest	
hmac-sha2-256	Approved and Non-Approved
hmac-sha1	Approved and Non-Approved
Encryption	
aes256-cbc	Approved and Non-Approved
aes128-cbc	Approved and Non-Approved
aes256-gcm	Non-Approved by policy
aes128-gcm	Non-Approved by policy

Table 5 – SSH Security Methods Available (Approved and non-Approved modes)

The module uses IPsec ESP mode only over UDP for data transport, using AES-128 and AES-256 in CBC mode. IKE is not used[3]; rather, the keys and IVs are generated by the module and provided to the peer over an out-of-band TLS tunnel[4].

Cipher Suite String (IETF enumeration)	Cipher	Auth	Mode
AES128-CBC-SHA	AES-128	SHA-1	Approved and Non-Approved
AES128-CBC-SHA256	AES-128	SHA256	Approved and Non-Approved
AES128-GCM-SHA256	AES-128	SHA256	Non-Approved by policy
AES256-CBC-SHA	AES-256	SHA-1	Approved and Non-Approved
AES256-CBC-SHA256	AES-256	SHA256	Approved and Non-Approved
AES256-GCM-SHA256	AES-256	SHA256	Non-Approved by policy

Table 6 – IPsec ESP Cipher and Digest Methods Available

[3] Since IKE is not used the IKE/IPSec KDF is not used
[4] The ESP protocol has not been reviewed or tested by the CAVP and CMVP

CAVP	Algorithm	Mode/Method	Strength[5]	Usage
5020	AES [197],[38A], [38D]	CBC, ECB, GCM	128, 256	Data Encryption/ Decryption [A].
5030	AES [197],[38A], [38D]	CBC, ECB, GCM	128, 256	Data Encryption/ Decryption [O].
5029	AES [197],[38A], [38D]	CBC, ECB, GCM	128, 256	Data Encryption/ Decryption [L].
Vendor Affirm	CKG [133][6]			Cryptographic Key Generation [A].
Vendor Affirm	CKG [133][7]			Cryptographic Key Generation [O].
Vendor Affirm	CKG [133][8]			Cryptographic Key Generation [L].
1581	CVL-SNMP[9] KDF [135]	SHA-1		SNMP AES key KDF.
1580	CVL-TLS[3] KDF [135]	TLS 1.0/1.1/1.2 (SHA-256)		TLS session keys KDF [L]
1579	CVL-SSH[3] KDF [135]	SHA-256		SSH v2 session key KDF
1575	CVL-TLS[3] KDF [135]	TLS 1.0/1.1/1.2 (SHA-256)		TLS session keys KDF. [O]
1836	DRBG[10] [90A]	CTR_DRBG	AES-256	Random Bit Generation [A].
1286	ECDSA [186]	P-256 (SHA-256) P-384 (SHA-384)		ECC Key Generation; Digital Signature Generation, Verification [O].
1285	ECDSA [186]	P-256 (SHA-256) P-384 (SHA-384)		ECC Key Generation; Digital Signature Generation, Verification [L].
3334	HMAC [198]	HMAC-SHA-1 HMAC-SHA-256 HMAC-SHA-384[11]	128 256 384	Message Authentication [A].
3344	HMAC [198]	HMAC-SHA-1 HMAC-SHA-256 HMAC-SHA-384[11]	128 256 384	Message Authentication. [O]
3343	HMAC [198]	HMAC-SHA-1[12] HMAC-SHA-1-96[12] HMAC-SHA-256 HMAC-SHA-384[11]	128 128 256 384	Message Authentication. [L]
2714	RSA [186]	n=1024[13] n=2048 (SHA-256, SHA-384) n=3072 (SHA-256, SHA-384)		RSA Key generation; Digital Signature Generation and Verification [O].
2713	RSA [186]	n=1024[13] n=2048 (SHA-256, SHA-384) n=3072 (SHA-256, SHA-384)		RSA Key generation; Digital Signature Generation and Verification. [L]
4079	SHS [180]	SHA-1, SHA-256, SHA-384, SHA-512[14]		Message Digest generation. [A]
4089	SHS [180]	SHA-1, SHA-256, SHA-384, SHA-512[14]		Message Digest generation. [O]
4088	SHS [180]	SHA-1, SHA-256, SHA-384, SHA-512[14]		Message Digest generation. [L]
2587	Triple-DES [67]	TCBC	3-Key (112)	Data Encryption/ Decryption [A]
2593	Triple-DES [67]	TCBC	3-Key (112)	Data Encryption/ Decryption [O]
2592	Triple-DES [67]	TCBC	3-Key (112)	Data Encryption/ Decryption [L]
AES 5030 & HMAC 3344	KTS [38F]	CBC, GCM, HMAC-SHA-1, HMAC-SHA-256	128, 256	Key Transport via TLS [O] Provides 128 or 256 bits of encryption strength.
Triple-DES 2593 & HMAC 3344	KTS [38F]	TCBC, HMAC-SHA-1, HMAC-SHA-256	3-Key (112)	Key Transport via TLS [O] Provides 112 bits of encryption strength.
AES 5020 & HMAC 3334	KTS [38F]	CBC, GCM, HMAC-SHA-1, HMAC-SHA-256	128, 256	Key Transport via TLS [A] Provides 128 or 256 bits of encryption strength.
Triple-DES 2587 & HMAC 3334	KTS [38F]	TCBC, HMAC-SHA-1, HMAC-SHA-256	3-Key (112)	Key Transport via TLS [A] Provides 112 bits of encryption strength.
Triple-DES 2592 & HMAC 3343	KTS [38F]	TCBC, HMAC-SHA-1	3-Key (112)	Key Wrapping [L] Provides 112 bits of encryption strength.

Table 7 – Approved algorithms (Implementations: [A]=avcrypto; [L]= libcrypto; [O] = ojdk)

[5] Strength indicates DRBG Strength, Key Lengths, Curves or Moduli

References to standards are given in square bracket [ ]; see the References table.
Items enclosed in curly brackets { } are CAVP tested but not used by the module in the Approved mode.
The module uses only the RSA functions shown above in the Approved mode under FIPS 186-4.

Algorithm	(Establishment) Strength	Use
Elliptic Curve Diffie-Hellman	Provides 128 or 192 bits of encryption strength.	Key establishment
MD5		TLS 1.0/1.1, password obfuscation.
NDRNG	Internal entropy source with rationale to support the claimed DRBG security strength. DRBG is seeded with at least 256 bits.	Entropy input to Approved DRBG.
RSA Key Wrapping	Provides 112 or 128 bits of encryption strength.	Key establishment

Table 8 - Allowed Algorithms

Algorithm	Use
RC4	Element of TLS ciphersuite allowed only in non-approved mode.
Elliptic Curve Diffie-Hellman And ECDSA using P-160	Element of TLS ciphersuite allowed only in non-approved mode.

Table 9 - Non-Approved Algorithms (Used only in the non-Approved Mode)

[6] The symmetric key or a generated seed is an unmodified output from a DRBG
[7] The symmetric key or a generated seed is an unmodified output from a DRBG
[8] The symmetric key or a generated seed is an unmodified output from a DRBG
[9] No parts of the TLS, SSH, and SNMP protocols, other than the KDF, have been tested by the CAVP. No parts of those protocols have been reviewed or tested by the CMVP.
[10] No prediction resistance; block_cipher_df derivation function used for instantiation.
[11] HMAC SHA-384 was tested but is not currently used
[12] HMAC-SHA-96 is also supported, by truncating existing HMAC-SHA-1 output to 96 bits
[13] RSA 1024 Signature Verification was tested but is not currently used
[14] SHA-512 was tested but is not currently used

2.1 Critical Security Parameters12/

All CSPs used by the module are described in this section.

Critical Security Parameters: G = Generation; S = Storage; E = Entry; O = Output; D = Destruction						
Name	Description and usage	G	S	E	O	D
AUTH-PW	Authentication Passwords, minimum of 8 characters, printable character set (95 unique values).	NA	S4	E4	NA	D2/D4
DRBG-EI	Entropy input (384 bits) to the block_cipher_df used to instantiate the Approved CTR_DRBG.	G4	S1	NA	NA	D1
DRBG-STATE	SP 800-90A CTR_DRBG V and K values (AES-256 Key, 128-bit V, per IG 14.5).	G3	S1	NA	NA	D1
ESP-SENC	ESP Session Encryption key. AES-128 or AES-256 key for IPsec ESP tunnel message encrypt/decrypt.	G3	S1	NA	O3	D1/D5
ESP-SMAC	ESP Session Authentication Keys. HMAC-SHA-1 160-bit or HMAC-SHA-256 256-bit session key for IPsec ESP message authentication.	G3	S1	NA	O3	D1/D5
OS-FWK	FirmWare authenticity key. HMAC-SHA-256 256-bit key used to verify firmware authenticity.	NA	S1/S3	E1	NA	D1/D2
OS-KEK	Key(store) encryption key. Triple-DES 192 bit key is used to encrypt CSPs in certificate storage.	NA	S1/S3	E1	NA	D1/D2
SAML-Priv	SAML private key. RSA (n=2048, n=3072) or ECDSA (P-256, P-384) private key used to digitally sign AAA SAML requests.	G6/NA	S1/S2	E3	O1	D1/D2/D3
SNMP-MS	SNMP (RFC 3414/3826) Master Secret. Secret used to derive (SP 800-135 SNMP KDF) SNMP-SMAC and SNMP-SENC.	NA	S1/S2	E4	NA	D1/D2
SNMP-SENC	SNMP (RFC 3414/3826) session encryption key. AES-128 key used to encrypt/decrypt SNMP messages.	G2	S1/S3	NA	NA	D1/D2
SNMP-SMAC	SNMP (RFC 3414/3826) session authentication key. HMAC-SHA-1-96 160-bit key used to verify SNMP message authenticity.	G2	S1/S3	NA	NA	D1/D2
SSH-Priv	SSH private key. RSA (n=3072) or ECDSA (P-256, P-384) private key used to establish SSH sessions.	G6	S1/S2	NA	NA	D1/D2
SSH-KEX-Priv	SSH ECDHE private key used for Key Exchange (P-256, P-384)	G6	S1	NA	NA	D1/D5
SSH-SENC	SSH Session Encryption Key. AES-128, AES-256 or 3-Key Triple-DES key for SSH message encrypt/decrypt.	G5	S1	NA	NA	D1/D5
SSH-SMAC	SSH Sesssion Authentication Key. HMAC-SHA-1 160-bit or HMAC-SHA-256 256-bit session key for SSH message authentication.	G5	S1	NA	NA	D1/D5
TLS-AMC-Priv	AMC TLS private key. RSA (n=2048, n=3072) or ECDSA (P-256, P-384) private key used to establish AMC TLS sessions.	G6/NA	S1/S2	E3	O1	D1/D2/D3
TLS-SENC	TLS Session Encryption Keys. AES-128, AES-256 or 3-Key Triple-DES key for TLS message encrypt/decrypt.	G1	S1	NA	NA	D1/D5
TLS-SMAC	TLS Session Authentication Keys. HMAC-SHA-1 160-bit or HMAC-SHA-256 256-bit session key for TLS message authentication.	G1	S1	NA	NA	D1/D5
TLS-WP-Priv	WorkPlace TLS private keys. RSA (n=2048, n=3072) or ECDSA (P-256, P-384) private key used to establish AMC TLS sessions.	G6/NA	S1/S2	E3	O1	D1/D2/D3
TLS-KEX-Priv	TLS ECDHE private key used for Key Exchange (P-256, P-384)	G6	S1	NA	NA	D1/D5

Table 10 – Critical Security Parameters (CSPs)

2.2 Public Keys

Public Keys: G = Generation; S = Storage; E = Entry; O = Output; D = Destruction					
Name	Description and usage	G	S	E	O
AAA-TLS-Pub	AAA Server public keys. RSA (n=2048, n=3072) or ECDSA (P-256, P-384) public key used by the policy service to establish VPN TLS sessions with LDAP AAA servers; and for verifying digital signatures from SAML and OCSP AAA servers .	NA	S1	E2	NA
CA-Pub	Trusted CA public keys. RSA (n=2048, n=3072) or ECDSA (P-256, P-384) public key used for VPN client devices path validation.	NA	S1/S3	E3	NA
DWS-TLS-Pub	Destination Web Server public key. RSA (n=2048, n=3072) or ECDSA (P-256, P-384) public key used by the module's VPN web proxy service to establish VPN TLS sessions with HTTPS web server resources.	NA	S1	E2	NA
LV-Pub	License Verification public key. RSA (n=2048) public key used to verify product licenses.	NA	S1/S3	E1	NA
SSH-Pub	SSH public key. RSA (n=3072) or ECDSA (P-256, P-384) public key used for SSH session establishment.	G6	S3	E3/E4	O2
SSH-KEX-Pub	SSH ECDHE public key used for Key Exchange (P-256, P-384)	G6	S1	NA	NA
TLS-AMC-Pub	AMC TLS public key. RSA (n=2048, n=3072) or ECDSA (P-256, P-384) public key used for AMC TLS session establishment.	G6	S3	E3/E4	O2
TLS-WP-Pub	Workplace site TLS public key. RSA (n=2048, n=3072) or ECDSA (P-256, P-384) public key used for VPN TLS session establishment.	G6	S3	E3/E4	O2
TLS-KEX-Pub	TLS ECDHE public key used for Key Exchange (P-256, P-384)	G6	S1	NA	NA

Table 11 – Public Keys

	Codes Used in CSP and Public Key Tables
Code	Meaning
G1	Generated on module using the CAVP validated SP 800-90A CTR_DRBG and SP 800-135 TLS KDF.
G2	Generated on module using the CAVP validated SP 800-90A CTR_DRBG and SP 800-135 SNMP KDF.
G3	Generated on module using the CAVP validated SP 800-90A CTR_DRBG.
G4	Generated by the entropy source, extracted from the entropy pool.
G5	Generated on module using the CAVP validated SP 800-90A CTR_DRBG and the SP 800-135 SSH KDF.
G6	Generated on module using the CAVP validated FIPS 186-4 RSA or ECDSA key generation and the SP 800-90A CTR_DRBG.
N/A	Generated externally.
G6/NA	Either G6 or generated externally.
S1	Stored in RAM, associated by memory location (pointer) as plaintext.
S2	Stored on fixed disk as 3DES ECB ciphertext.
S3	Stored on fixed disk as plain text.
S4	Stored hashed by MD5 (equivalent to plaintext).
S1/S2	Either S1 or S2.
S1/S3	Either S1 or S3.
E1	Entered in a manufacturing setting or firmware load.
E2	Encrypted via TLS handshake (refers to RSA key transport or EC DH key agreement)
E3	Imported as a PKCS12 certificate
E4	Entered via web Administration GUI
E3/E4	Either E3 or E4.
O1	Exported in PKCS12 format encrypted by 3-Key Triple-DES with SHA-1 MAC
O2	Output unencrypted (Public key only)
O3	Output via TLS
D1	RAM copy of CSP destroyed by power cycling the module.
D2	Destroyed by system zeroization (disk wiped)
D3	Deleted from key store when the certificate is removed
D4	Deleted when user account removed
D5	Deleted on session closure
D1/D2	Either D1 or D2
D1/D5	Either D1 or D5
D1/D2/D3	Either D1, D2 or D3
D2/D4	Either D2 or D4.

Table 12 - Codes for CSP and Public Key Tables

3 Roles, Authentication and Services

3.1 Assumption of Roles

The module supports the operator roles and associated authentication methods listed in Table 13.

The Module does not support a maintenance role or bypass capability. The Module supports concurrent users, enforcing separation of roles by the partitioning of major subsystems (such as VPN traffic vs. shell or AMC administrative functions), and by partitioning of the administrative interfaces (e.g.,. by organization of the AMC web GUI pages). Authentication status does not persist across module power cycles. The module does not permit multiple concurrent operators in the same role: to change roles, an operator must first log out, then log in using another role. Table 13 lists the available roles.

Role		Authentication	
ID	**Description**	**Type**	**Data**
CO	Cryptographic Officer – Has full access to administer and configure the module as well as delegate admin access control rights to Admin users.	Identity-based (using *Local password verification*) or role-based (using *Transitive trust with authentication*) dependent on configured policy.	Username and PIN or X.509 certificate
User	Admin User – Configure and administer the module per the delegated access rights assigned by the CO.		
VPN	Typical end user accessing the virtual private network resources via an encrypted connection.		
SNMP	SNMP agent and trap – provides module status via SNMP messages	Identity-based (using *SNMP authentication*)	SNMP-SMAC

Table 13 – Roles Description

3.2 Authentication Methods

The *Local password verification* method requires an 8 character minimum password using characters in the printable character set. The maximum rate for local password authentication is conservatively estimated to be approximately one (1) attempt per microsecond.

Hence the probability of false authentication is less than the required 1/1,000,000: 1/(95^8) = **1.5E-16**

And the probability of false authentication in a one minute period is less than the required 1/100,000: (60*10^6)/(95^8) = **9.0E-9**

The *Transitive trust with authentication* method first establishes a secure connection to an external authentication server, which authenticates to the module using X.509 certificates. Subsequent interaction with the authentication server determines the applicable access rights; as such, this method is a role-based authentication method. The maximum rate for local password authentication is conservatively estimated to be approximately one (1) attempt per microsecond.

Based on the minimum strength SAML key (RSA 2048) security strength of 112 bits, the probability of false authentication is less than the required 1/1,000,000: 1/(2^112) = **1.9E-34**

And the probability of false authentication in a one minute period is less than the required 1/100,000: (60*10^6)/(2^112) = **1.2E-26**

SNMP authentication method: communications established with an SNMP client include verification of a initial message, confirming a 96-bit truncated HMAC-SHA-1 value calculated using the SNMP-SMAC key and a designated message , with maximum processing rate measured on the fastest configuration as requiring at minimum one microsecond:

Hence the probability of false authentication is less than the required 1/1,000,000: 1/(2^96) = **1.3E-29**

And the probability of false authentication in a one minute period is less than the required 1/100,000: (60*10^6)/(2^96) = **7.6E-22**

3.3 Services

All services implemented by the module are listed in the tables below.

Service	Description	CO	SNMP	User	VPN
Shell Interface	Shell interface via the console serial port using SSH to perform limited module configuration and administration. Uses the following cryptographic security functionality (unless otherwise noted, using Libcrypto certs marked "[L]" in Table 7): - SSH handshake (see Table 5 "Key Exchange", "Host Key Authentication") - Generate session keys (Cert. #1579 SSH KDF; Cert. #1836 DRBG) - Secure channel operation (See Table 5 "Encryption" and "Digest")	X			
AMC Interface	Use of the Administration Management Console (Web GUI) using TLS (via https). Uses the following cryptographic security functionality (unless otherwise noted, using Libcrypto certs marked "[O]" in Table 7): - TLS handshake (see Table 4 "TLS" and "Key Exchange" Columns) - Generate session keys (Cert. #1575 ojdk TLS KDF; Cert. #1836 DRBG) - Secure channel operation (See Table 5 "Cipher" and "Digest")	X		X	
Admin User Access Rights Administration	The creation of new Administrative users, Administrative user access rights and authentication sources through the AMC.	X		X	
Security Administration	Administrator access to pages for VPN end user access control rules, resources, users and groups, web portal services and client end point control.	X		X	
System Configuration	Administrator access to pages for network settings, Licensing, SSL settings, access and network services, authentication servers and realms, and the switching in and out of FIPS mode of operation.	X		X	
System Maintenance ***(includes Zeroization)***	Administrator permission to shut down or restart the appliance, update or roll back the system software, and import or export configuration data, and ***zeroize all CSPs*** .	X		X	
System Monitoring	Read access permits the administrator to view system logs and graphs, view active users and run troubleshooting tools. Write access permits termination of VPN End Users and to change logging levels.	X		X	
Remote Assistance	Read access permits viewing of the service configuration and the trouble ticket queue. Write access permits modify the service configuration and reorder the trouble ticket queue.	X		X	
SNMP	Read access permits external SNMP monitoring system to query on MIBS. Uses the following cryptographic security functionality (unless otherwise noted, using Libcrypto certs marked "[L]" in Table 7): - Generate session keys (Cert. #1581 SNMP KDF; Cert. #1836 DRBG) - Secure channel operation (Cert. #5029 AES)		X		
VPN network traffic	Establish an encrypted connection via the VPN TLS and VPN ESP interfaces. Uses the following cryptographic security functionality (unless otherwise noted, using Libcrypto certs marked "[A]" in Table 7): - TLS handshake (see Table 4 "TLS" and "Key Exchange" Columns) - Generate session keys (Cert. #1580 OpenSSL TLS KDF; Cert. #1836 DRBG) - Secure channel operation (See Table 5 "Cipher" and "Digest")	X		X	X

Table 14 – Authenticated Services

Unauthenticated Services	
Service	**Description**
Module Reset (Self-test)	Reset the Module by the AMC interface, physical power removal, or shell interface. This service executes the suite of self-tests required by FIPS 140-2. Performed by power-cycling or rebooting the module.
Show Status	This service provides the current status of the cryptographic module on the LED and LCD interfaces as well as low level response from the network interfaces.

Table 15 – Unauthenticated Services

Table 16 defines the relationship between access to CSPs and the different module services. The modes of access shown in the table are defined as:

- G = Generate: The module generates the CSP.
- R = Read: The module reads the CSP. The read access is typically performed before the module uses the CSP.
- E = Execute: The module executes using the CSP.
- W = Write: The module writes the CSP. The write access is typically performed after a CSP is imported into the module, when the module generates a CSP, or when the module overwrites an existing CSP.
- Z = Zeroize: The module zeroizes the CSP.

4 Self-tests

Each time the module is powered up it tests that the cryptographic algorithms still operate correctly and that sensitive data have not been damaged. Power up self–tests are available on demand by power cycling the module.

On power up or reset, the module performs the self -tests described in below. All KATs must be completed successfully prior to any other use of cryptography by the module. The Test LED is lit only during power-self-test. If any power-up self-test fails, the module remains in the *FIPS Error* state, indicated by the Test and Alarm LEDs remaining lit, until it is reset. Self-test status is also shown on the console and captured into system logs.

Test Target	Description
Firmware Integrity	HMAC-SHA-256 performed over all code in EEPROM.
AES [A]	Separate KATs for each permutation of: encrypt, decrypt functions; 128, 256 bit keys; CBC, ECB, and GCM modes.
AES [L]	Separate KATs for each permutation of: encrypt, decrypt functions; 128, 256 bit keys; CBC, ECB and GCM modes.
AES [O]	Separate KATs for each permutation of: encrypt, decrypt functions; 128, 256 bit keys; CBC, ECB and GCM modes.
DRBG [A]	AES-256 CTR DRBG test. Performed conditionally (where initial use at power-up is the condition) per SP 800-90 Section 11.3.
ECDSA [L]	Separate signature generation and signature verification KAT's as well as a PCT are performed using a P-256 key.
ECDSA [O]	Separate signature generation and signature verification KAT's as well as a PCT are performed using a P-256 key.
HMAC [A]	Separate HMAC generation and HMAC verification KATs, using SHA-1 and SHA-256. [12]
HMAC [L]	Separate HMAC generation and HMAC verification KATs, using SHA-1 and SHA-256. [12]
HMAC [O]	Separate HMAC generation and HMAC verification KATs, using SHA-1 and SHA-256.[12]
RSA [L]	Separate KATs of n=2048 bit signature generation and signature verification.
RSA [O]	Separate KATs of n=2048 bit signature generation and signature verification.
SHS [A]	Separate KATs of SHA-1, SHA-256, SHA-384[15]
SHS [L]	Separate KATs of SHA-1, SHA-256, SHA-384[15]
SHS [O]	Separate KATs of SHA-1, SHA-256, SHA-384[15]
Triple-DES [A]	Separate KATs of Encryption, Decryption using 3-key TECB.
Triple-DES [L]	Separate KATs of Encryption, Decryption using 3-key TECB.
Triple-DES [O]	Separate KATs of Encryption, Decryption using 3-key TECB.
TLSKDF [O] [SSL]	TLSv1, TLSv2 SHA-256, TLSv2 SHA-384
SSHKDF [SSH]	SHA-1, SHA-256
SNMPKDF [SNMP]	SHA1
CSP Integrity	(Critical function) A CSP integrity test is performed at power-on and at each system configuration invocation and configuration update.

Table 17 – Power Up Self-tests

[15] IG 9.4 requires separate self-tests of each of the SHA-1, SHA-256 and SHA-384 methods. IG 9.4 requires an HMAC KAT for at least one of the implemented underlying SHS methods.

Test Target	Description
CSP Integrity	(Critical function) A CSP integrity test is performed at power-on and at each system configuration invocation and configuration update.
DRBG	AS09.42 Continuous RNG Test performed when a random value is requested from the DRBG.
ECDSA	ECDSA Pairwise Consistency Test performed on every ECDSA key pair generation.
Firmware Load	HMAC-SHA-256 verification performed when firmware is loaded. HMAC-SHA-1 is possible to use only for fallback scenarios.
NDRNG	AS09.42 Continuous RNG Test performed when a random value is requested from the NDRNG.
RSA	RSA Pairwise Consistency Test performed on every RSA key pair generation.

Table 18 – Conditional Self-tests

5 Physical Security Policy

Each cryptographic module includes the following physical security mechanisms:

- Production-grade components and production-grade opaque enclosure
- Tamper-evident material and seals
- Protected vents

Some module components (e.g., hard drives) are field replaceable. Hard drives shall not be replaced in the FIPS module, an appliance with a failed hard drive must be returned for RMA. The removable fans of the SMA 7200 and SMA 6200 and the removable power supplies of the EX-9000 and SMA-7200 can be field replaced without issues because they are outside the cryptographic boundary, and aren't covered by tamper labels. The location and placement of tamper seals for each configuration are shown in the figures below. The tamper-evident seals shall be installed for the module to operate in a FIPS mode of operation. EX-9000 requires seven (7) seals placed as shown in Section 5.1. SMA 6200 and SMA 7200 require two (2) seals as shown in Section 5.2.

An operator in the CO role is responsible for the following:

- Directly controlling and monitoring module reconfigurations where the tamper- evident seals are removed and re-installed, to ensure that the security of the module is maintained during component replacement and that the module is returned to a FIPS Approved state.
- Securing and controlling any unused tamper seals.

Physical Security Mechanism	Recommended Frequency of Inspection/Test	Inspection/Test Guidance Details
Tamper-evident Seals	Inspect tamper-evident seals monthly.	See the SonicWALL Aventail Secure Remote Access Installation and Administration Guide Version 12.0 for procedure.

6 Operational Environment

The Module is designated as a limited operational environment under the FIPS 140-2 definitions; see the statement in §1 *Introduction* ¶2.

7 Mitigation of Other Attacks Policy

The modules have not been designed to mitigate attacks outside the scope of FIPS 140-2.

8 Security Rules and Guidance

The Module design corresponds to the module security rules. The module implements and enforces the following security rules:

1. An unauthenticated operator does not have access to any CSPs or cryptographic services.
2. The module inhibits data output during power up self-tests and error states.
3. Status information does not contain CSPs or sensitive data that if misused could lead to a compromise of the module.
4. Certificates are entered and output from the module in PKCS #12 format which stores but does not protect them. All import and export of key values shall be performed over VPN tunnels.
5. Zeroization overwrites all CSPs. Performance of the zeroization process will prevent the module from successfully booting, effectively disabling the module. The operator is required to be physically present while the module completes this process. The process may take up to one (1) hour to complete.
6. The module does not share CSPs between the Approved mode of operation and the non-Approved mode of operation.

The following security rules must be adhered to for operation in the FIPS 140-2 Approved mode:

1. Before enabling the FIPS Approved mode, a strong password, secure connection to the authentication server, and valid license are required.
2. The module must be configured for FIPS Security as detailed in §1.2, with no warnings present.
3. Passwords must be at least 8 characters; Good practice is to use 14 characters or more with a mix of numbers, letters and symbols.
4. Do not use RSA Authentication Manager servers without strong passwords as shared secrets.
5. USB ports may be used for disaster recovery system restoration only.
6. Do not use eSATA devices for any purpose.
7. Do not Load or unload any kernel modules via the shell command line.
8. Do not Install third party software via the shell command line.
9. Do not attempt Firmware upgrades via the shell command line.
10. Do not use Debug 1, Debug 2, Debug 3 or plaintext logs. Plaintext logs do not contain CSPs, but may contain information sensistive to users.
11. Do not use certificates with private/public key-pairs generated by non-FIPS validated systems.
12. Confirm physical security protections in accordance with Section 5, *Physical Security Policy.*
13. In case the module's power is lost and then restored, a new key for use with the AES GCM encryption/decryption is established.
14. Do not use AES-GCM for SSH or IPSEC

Table 20 – References

Term	Definition
AAA	Authentication, Authorization and Accounting - access control, policy enforcement and auditing framework for computing systems, e.g. LDAP
AMC	Administration Management Console
ESP	Encapsulated Security Payload (a subset of IPsec, Internet Protocol Security)
IKE	Internet Key Agreement, a key agreement scheme associated with IPsec (but not used by the module)
GMS	Global Management System
GUI	Graphical User Interface
LDAP	Lightweight Directory Access Protocol
PKCS #12	Public-Key Cryptography Standards #12, regarding certificate formats.
RADIUS	Remote Authentication Dial-In Service
SAML	Security Assertion Markup Language
SNMP	Simple Network Management Protocol
SSH	Secure Shell
VPN	Virtual Private Network
TLS	Transport Layer Security
