## Introduction

This document is the non-proprietary FIPS 140-2 Security Policy of F5® Device Cryptographic Module with firmware version 13.1.1 EHF and hardware version listed in table 1. It contains the security rules under which the module must operate and describes how this module meets the requirements as specified in FIPS PUB 140-2 (Federal Information Processing Standards Publication 140-2) for a Security Level 2 module.

## 1. Cryptographic Module Specification

The following section describes the cryptographic module and how it conforms to the FIPS 140-2 specification in each of the required areas.

### 1.1. Module Description

The F5® Device Cryptographic Module (hereafter referred to as “the module”) is a smart evolution of Application Delivery Controller (ADC) technology. Solutions built on this platform are load balancers. They’re full proxies that give visibility into, and the power to control—inspect and encrypt or decrypt—all the traffic that passes through your network.

Underlying all BIG-IP hardware and software is F5’s proprietary operating system, TMOS, which provides unified intelligence, flexibility, and programmability. With its application control plane architecture, TMOS gives you control over the acceleration, security, and availability services your applications require. TMOS establishes a virtual, unified pool of highly scalable, resilient, and reusable services that can dynamically adapt to the changing conditions in data centers and virtual and cloud infrastructures. The module has been tested on the multichip standalone devices listed in Table 1 below with the firmware version 13.1.1 EHF.

Hardware	Processor <sup>1</sup>	Operating System	Specifications
BIG-IP i4000	Intel® Xeon® D-1518	TMOS 13.1.1 EHF	1 x USB 8 x 1GbE; 4 x 10GbE network ports 1 x Console port 1 x 1GbE management port 4 x LEDs
BIG-IP i5000	Intel® Xeon® E5-1630	TMOS 13.1.1 EHF	1 x USB port 8 x 1GbE; 4 x 40GbE network ports 1 x Console port 1 x GbE management port 4 x LEDs
BIG-IP i5820-DF	Intel® Xeon® E5-1630	TMOS 13.1.1 EHF	1 x USB port 8 x 10GbE; 4 x 40GbE network ports 1 x Console port 1 x 1GbE management port 4 x LEDs
BIG-IP i7000	Intel® Xeon® E5-1650	TMOS 13.1.1 EHF	1 x USB port 8 x 1GbE; 6 x 10GbE network ports 1 x Console port 1 x 1GbE management port 4 x LEDs
BIG-IP i7820-DF	Intel® Xeon® E5-1650	TMOS 13.1.1 EHF	1 x USB port 8 x 10GbE; 4 x 40GbE network ports 1 x Console port 1 x 1GbE management port 4 x LEDs
BIG-IP i10800	Intel® Xeon® E5-1660	TMOS 13.1.1 EHF	1 x USB port 8 x 10GbE; 6 x 40GbE network ports 1 x Console port 1 x 1GbE management port 4 x LEDs
BIG-IP i11800-DS	Intel® Xeon® E5-2695	TMOS 13.1.1 EHF	1 x USB port 8 x 10GbE; 6 x 40GbE network ports 1 x Console port 1 x 1GbE management port 4 x LEDs
BIG-IP i15800	Intel® Xeon® E5-2680	TMOS 13.1.1 EHF	1 x USB port 8 x 40GbE; 4 x 100GbE network ports 1 x Console port 1 x 1GbE management port 4 x LEDs
BIG-IP 4000	Intel® Xeon® E3-1125C	TMOS 13.1.1 EHF	1 x USB port 8 x 1GbE; 2 x 10GbE network ports 1 x Console port 1 x GbE management port 4 x LEDs
BIG-IP 5250v-F	Intel® Xeon® E3-1230	TMOS 13.1.1 EHF	2 x USB port 4 x 1GbE; 8 x 10GbE network ports 1 x Console port 1 x GbE management port 4 x LEDs

<sup>1</sup> The modules make use of AES-NI instruction provided by the underlying processor.

Hardware	Processor <sup>1</sup>	Operating System	Specifications
BIG-IP 7000	Intel® Xeon® E3-1275	TMOS 13.1.1 EHF	1 x USB port 8 x 1GbE; 2 x 10GbE network ports 1 x Console port 1 x GbE management port 4 x LEDs
BIG-IP 7200v-F	Intel® Xeon® E3-1275	TMOS 13.1.1 EHF	2 x USB port 4 x 1GbE; 8 x 10GbE network ports 1 x Console port 1 x GbE management port 4 x LEDs
BIG-IP 10200v-F	Intel® Xeon® E5-1650	TMOS 13.1.1 EHF	1 x USB port 16 x 10GbE; 2 x 40GbE network ports 1 x Console port 1 x GbE management port 4 x LEDs
BIG-IP 10350v-F	Intel® Xeon® E5-2658	TMOS 13.1.1 EHF	1 x USB port 16 x 10GbE; 2 x 40GbE network ports 1 x Console port 1 x GbE management port 4 x LEDs
VIPRION B2250	Intel® Xeon® E5-2658	TMOS 13.1.1 EHF	1 x USB port 4 x 40 GbE network ports 1 x Console port 1 x GbE management port 4 x LEDs
VIPRION B4450	Intel® Xeon® E5-2658A	TMOS 13.1.1 EHF	1 x USB port 4 x 40 GbE; 2 x 100 GbE network ports 1 x Console port 1 x GbE management port 4 x LEDs

Table 1 – Tested Modules

## 1.2. FIPS 140-2 Validation Level

For the purpose of the FIPS 140-2 validation, the F5® Device Cryptographic Module is defined as a multi-chip standalone hardware cryptographic module validated at overall security level 2. The table below shows the security level claimed for each of the eleven sections that comprise the FIPS 140-2 standard:

FIPS 140-2 Section		Security Level
1	Cryptographic Module Specification	2
2	Cryptographic Module Ports and Interfaces	2
3	Roles, Services and Authentication	2
4	Finite State Model	2
5	Physical Security	2
6	Operational Environment	N/A
7	Cryptographic Key Management	2
8	EMI/EMC	2
9	Self-Tests	2
10	Design Assurance	2
11	Mitigation of Other Attacks	N/A
Overall Level		2

*Table 2 – Security Levels*

## 1.3. Description of modes of operation

The module must be installed in the FIPS validated configuration as stated in Section 8 – Guidance. In the operational mode the module supports two modes of operation:

- in "FIPS mode" (the FIPS Approved mode of operation) only approved or allowed security functions with sufficient security strength can be used.
- in "non-FIPS mode" (the non-Approved mode of operation) only non-approved security functions can be used.

The module enters operational mode after power-up tests succeed. Once the module is operational, the mode of operation is implicitly assumed depending on the security function invoked and the security strength of the cryptographic keys. Critical Security Parameters (CSPs) used or stored in FIPS mode are not used in non-FIPS mode, and vice versa.

In the FIPS Approved Mode, the cryptographic module will provide the following CAVP certified cryptographic algorithms.

Algorithm	Usage	Keys/CSPs	Certificate Number(s)
AES-ECB AES-CBC AES-GCM	Encryption and Decryption	128/192/256-bit AES key	C2, C33, C34, C35, C36, C37, C40, C41, C42, C43, C44, C45, C46, C47, C48, C49
AES-CBC AES-GCM		128/256-bit AES key	C52, C53, C54, C55, C57, C58, C62, C63, C64, C65, C67, C68, C69, C70, C71, C75
SP800-90A CTR_DRBG	Random Number Generation	Entropy input string, V and Key values	C2, C33, C34, C35, C36, C37, C40, C41, C42, C43, C44, C45, C46, C47, C48, C49, C52, C53, C54, C55, C57, C58, C62, C63, C64, C65, C67, C68, C69, C70, C71, C75
FIPS 186-4 RSA Key Pair Generation	RSA Key Generation	RSA public and private key pair with 2048/3072-bit modulus size	C2, C33, C34, C35, C36, C37, C40, C41, C42, C43, C44, C45, C46, C47, C48, C49
PKCS#1 v1.5 RSA Signature Generation and Signature Verification with SHA-256 and SHA-384	RSA Signature Generation and Verification	RSA private key with 2048/3072-bit modulus	C2, C33, C34, C35, C36, C37, C40, C41, C42, C43, C44, C45, C46, C47, C48, C49, C52, C53, C54, C55, C57, C58, C62, C63, C64, C65, C67, C68, C69, C70, C71, C75
FIPS 186-4 ECC Key Pair Generation (Appendix B.4.2)	ECDSA Key Pair Generation	ECDSA/ECDH public/private key pair for P-256 and P-384 curves	
FIPS 186-4 ECDSA Signature Generation and Signature Verification	ECDSA Signature Generation and Verification	ECDSA private key (P-256, P-384 curves)	
SHA-1 SHA-256 SHA-384	Message Digest	N/A	
HMAC-SHA-1 HMAC-SHA-256 HMAC-SHA-384	Message Authentication	HMAC key (>=112-bit)	

SP800-56A ECC except KDF (Section 5.7.1.2 ECC CDH Primitive)	Key Agreement Scheme (KAS)	private Key with P-256 and P-384 curves	
Key Derivation	SP800-135 Key Derivation in SSH	Session encryption and data authentication keys	C2, C33, C34, C35, C36, C37, C40, C41, C42, C43, C44, C45, C46, C47, C48, C49
	<sup>2</sup> TLS 1.0/1.1/1.2 with SHA-256 and SHA-384		C2, C33, C34, C35, C36, C37, C40, C41, C42, C43, C44, C45, C46, C47, C48, C49, C52, C53, C54, C55, C57, C58, C62, C63, C64, C65, C67, C68, C69, C70, C71, C75

Table 3 – FIPS Approved and Allowed Algorithms

Algorithm	Usage	Keys/CSPs	Certificate Number(s)
EC Diffie-Hellman	Key Agreement	private key with P-256 and P-384 curves	Non-Approved but Allowed
RSA PKCS	Key Wrapping	RSA key pair with 2048/3072-bit modulus size	Non-Approved but Allowed
NDRNG	N/A	seed	Non-Approved but Allowed

Table 3a – FIPS Non-Approved but Allowed Algorithms

Algorithm	Usage	Notes
AES	Symmetric Encryption and Decryption	using OFB, CFB, CTR, XTS and KW modes
DES RC4 Triple-DES		n/a
RSA	Asymmetric Encryption and Decryption	using modulus sizes less than 2048-bits or greater than 3072 bits
RSA	Asymmetric Key Generation	FIPS 186-4 less than 2048-bit modulus size or greater than 3072-bits
DSA		using any key size

<sup>2</sup> No parts of the TLS protocol except the KDF has been reviewed or tested by the CAVP and CMVP.

ECDSA ECDH		using public/private key pair for curves other than P-256 and P-384
RSA	Digital Signature Generation and Verification	PKCS#1 v1.5 using key sizes other than 2048 and 3072 bits
		PKCS#1 v1.5 using SHA-1, SHA-224 and SHA-512
		using X9.31 standard
		using Probabilistic Signature Scheme (PSS)
DSA		using any key size and SHA variant
ECDSA		FIPS 186-4 using curves other than P-256 and P-384
		FIPS 186-4 using curves P-256 and P-384 with SHA-1, SHA-224 and SHA-512
SHA-224 SHA-512 MD5	Message Digest	N/A
HMAC-SHA-224 HMAC-SHA-512 AES-CMAC Triple-DES-CMAC	Message Authentication	N/A
Diffie-Hellman	Key Agreement Scheme (KAS)	N/A
ECDH		using curves other than P-256 and P-384
TLS KDF	Key Derivation function	Using SHA-1/SHA-224/SHA-512
SSH KDF		
SNMP KDF		
IKEv1 and IKEv2 KDF		using any SHA variant

*Table 4 – Non-FIPS Approved Algorithms/Modes*

### 1.4. Cryptographic Module Boundary

The cryptographic boundary of the module is defined by the exterior surface of the appliance (red dotted line). The block diagram below shows the module, its interfaces with the operational environment and the delimitation of its logical boundary.

#### 1.4.1. Hardware Block Diagram

The block diagram below depicts the flow of status output (SO), control input (CI), data input (DI) and data output (DO). Description of the ports and interfaces can be found in *Table 5 – Ports and Interfaces* below.

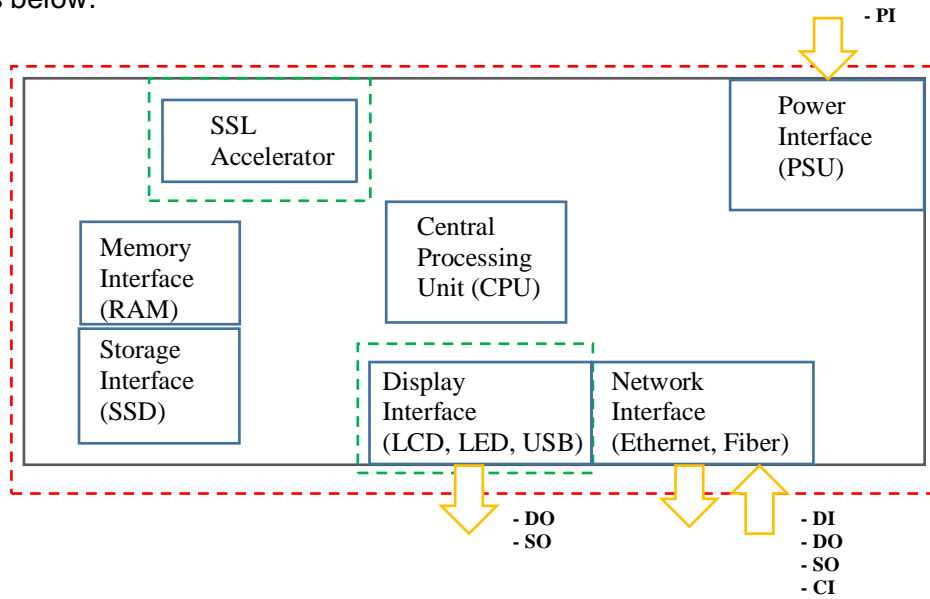

Figure 1 – Hardware Block Diagram

## 2. Cryptographic Module Ports and Interfaces

For the purpose of the FIPS 140-2 validation, the physical ports are interpreted to be the physical ports of the hardware platform on which it runs.

The logical interfaces are the commands through which users of the module request services. The following table summarizes the four physical interfaces with details of the FIPS 140-2 logical interfaces they correspond to:

Logical Interface	Physical Interface	Description
Data Input	Network Interface	Depending on module, the network interface consists SFP, SFP+, and/or QSFP+ ports (Ethernet and/or Fiber Optic) which allow transfer speeds from 1Gbps to up to 40Gbps.
Data Output	Network Interface Display Interface	Depending on module, the network interface consists SFP, SFP+, and/or QSFP+ ports (Ethernet and/or Fiber Optic) which allow transfer speeds from 1Gbps to up to 40Gbps. In addition, Status logs may be output to USB found in the interface.
Control Input	Display Interface Network Interface	The control input found in the display interface includes the power button and reset button. The control input found in the network interface includes the API which control system state (e.g. reset system, power-off system).
Status Output	Display Interface	Depending on model, the display interface can consist of a LCD display, LEDs, and/or output to STDOUT which provides system status information.
Power Input	Power Interface	Removable PSU (x2)

*Table 5 - Ports and Interfaces*

The images below show the various modules that were tested. Please use the images to familiarize yourself with the devices.

### 3. Roles, Services and Authentication

#### 3.1. Roles

The module supports role-based authentication and the following roles are defined:

- **User role:** Performs cryptographic services (in both FIPS mode and non-FIPS mode), key zeroization, module status requests, and on-demand self-tests. The FIPS140-2 role of User is mapped to multiple BIG-IP roles which are responsible for different components of the system (e.g. auditing, certificate management, user management, etc.). The user can access the module through CLI or Web Interface described below. However, the CO can restrict User Role access to the CLI interface. In that case the User will have access through web interface only.
- **Crypto Officer (CO) role:** Crypto officer is represented by the administrator of the BIG-IP. This entity performs module installation and initialization. This role has full access to the system and has the ability to create, delete, and manage other user roles on the system.

Two interfaces can be used to access the module:

1. **CLI:** The module offers a CLI called traffic management shell (tmsh) which can be accessed remotely using the SSHv2 secured session over the Ethernet ports.
2. **Web Interface:** The Web interface consists of HTTPS over TLS interface which provides a graphical interface for system management tools. The web interface can be accessed from a TLS-enabled web browser.

Note: The module does not maintain authenticated sessions upon power cycling. Power-cycling the system requires the authentication credentials to be re-entered. When entering authentication data through the Web interface, any character entered will be obfuscated (i.e. character entered replaced with a dot on the entry box). When entering authentication data through the CLI, the module does not display any character entered by the operator in stdin (e.g. keyboard).

FIPS 140-2 Role	BIG-IP Role	Purpose of Role
Crypto Officer	Administrator	Main administrator of the of the BIG-IP system. This role has complete access to all objects on the system. Entities with this role cannot have other roles on the system.
User	Auditor	Entity who can view all configuration data on the system, including logs and archives.
	Certificate Manager	Entity who manages digital certificates and keys.
	Firewall Manager	Grants a user permission to manage all firewall rules and supporting objects. Notably, the Firewall Manager role has no permission to create, update, or delete non-network firewall configurations, including Application Security or Protocol Security policies.
	iRule Manager	Grants a user permission to create, modify, view, and delete iRules. Users with this role cannot affect the way that an iRule is deployed.
	Operator	Grants a user permission to enable or disable nodes and pool members. When granted terminal access.

FIPS 140-2 Role	BIG-IP Role	Purpose of Role
	Resource Manager	Grants a user access to all objects on the system except BIG-IP user accounts. With respect to user accounts, a user with this role can view a list of all user accounts on the system but cannot view or change user account properties except for their own user account. Users with this role cannot have other user roles on the system.
	User Manager	Entity who manages BIG-IP crypto officer accounts.

Table 6 – FIPS 140-2 Roles

### 3.2. Authentication

FIPS 140-2 Role	Authentication type and data	Strength of Authentication (Single-Attempt)	Strength of Authentication (Multiple-Attempt)
Crypto Officer	Password based (CLI or Web Interface)	<p>The password must consist of minimum of 6 characters with at least one from each of the three character classes. Character classes are defined as: digits (0-9), ASCII lowercase letters (a-z), ASCII uppercase letters (A-Z)</p> <p>Assuming a worst-case scenario that comprises 6 (six) characters that consist of a set of 4 (four) digits, 1 (one) ASCII lowercase letter and 1 (one) ASCII uppercase letter. The probability to guess every character successfully is <math>(1/10)^4 * (1/26)^1 * (1/26)^1 = 1/6,760,000</math> which is much smaller than <math>1/1,000,000</math>.</p>	<p>The maximum number of login attempts is limited to 6 after which the account is locked. This means that at worst case an attacker has the probability of guessing the password in one minute as <math>6/6,760,000</math> which is less than the requirement of <math>1/100,000</math>.</p>
User	Password based (CLI and Web Interface)	<p>The password must consist of minimum of 6 characters with at least one from each of the three character classes. Character classes are defined as: digits (0-9), ASCII lowercase letters (a-z), ASCII uppercase letters (A-Z)</p> <p>Assuming a worst-case scenario that comprises 6 (six) characters that consist of a set of 4 (four) digits, 1 (one) ASCII lowercase letter and 1 (one) ASCII uppercase letter. The probability to guess every character successfully is <math>(1/10)^4 * (1/26)^1 * (1/26)^1 = 1/6,760,000</math> which is much smaller than <math>1/1,000,000</math>.</p>	<p>The maximum number of login attempts is limited to 6 after which the account is locked. This means that at worst case an attacker has the probability of guessing the password in one minute as <math>6/6,760,000</math> which is less than the requirement of <math>1/100,000</math>.</p>

Table 7 – Authentication of Roles

### 3.3. Services

The module provides services to users that assume one of the available roles. All services are described in detail in the user documentation.

The first table lists the module's services that can be performed without authentication. Subsequent tables list the Approved services and the non-Approved but allowed services in FIPS mode of operation, the roles that can request the service, the algorithms involved with their corresponding CAVS certificate numbers (if applicable), the CSPs involved and how they are accessed. The final set of tables show the non-FIPS Approved services that only can be executed in the non-FIPS mode.

Service	Access Type (R, W, Z)	Usage/Notes
Show Status	R	Displays system status information over LCD screen (e.g. network info, system operational status, etc.).
Self-Tests	R	When the BIG-IP system has been started, the Self-Tests are performed. This includes the integrity check and Known Answer Tests. On-Demand self-tests are initiated by manually power cycling the system.

Table 8 – Non-Authenticated Services

Table 9 lists the Management Services available in FIPS mode of operation which are only available after authentication has succeeded. Use of any of the following services using non-approved algorithms will place the module in non-approved mode.

Service	Description	Access Type (R, W, Z) Read/Write/Zeroize	Authorization	
			Crypto Officer	User
<b>User Management Services</b>				
List Users	Display list of users	R	✓	User Manager Resource Manager
Create User	Create additional users	W	✓	User Manager
View Users	View users	R	✓	User Manager
Delete User	Delete users from module	W	✓	User Manager
Unlock User	Remove Lock from user who has exceeded login attempts	W, R	✓	User Manager
Update own password	Update own password	W	All Roles	
Update others password	Update password for user that is not self	W	✓	User Manager

Service	Description	Access Type (R, W, Z) Read/Write/Zeroize	Authorization	
			Crypto Officer	User
Configure Password Policy	Set password policy features	W	✓	None
<b>Certificate Management Services</b>				
Create SSL Certificate	Generate a self-signed certificate	W	✓	Certificate Manager
Create SSL Key	Generate SSL Certificate key file	W	✓	Certificate Manager
Check-Cert	Examines certificate and display or logs expiration date of installed certificates	R, W	✓	Certificate Manager
List Certificates	Display certificates installed	R	✓	Certificate Manager
Import SSL Certificate	Import SSL certificate into module	R	✓	Certificate Manager
Delete SSL Certificate	Delete a certificate from the module.	Z	✓	Certificate Manager
Export Certificate File	Export SSL certificate into module	W	✓	Certificate Manager
ssh-keyswap utility service	Use ssh-keyswap utility to create or delete ssh keys	R, W	✓	Certificate Manager
<b>Firewall Management Services</b>				
Configure firewall settings	Configure firewall policy rules, and address-lists for use by firewall rules.	R, W	✓	Firewall Manager
Show firewall state	Display the current system-wide state of firewall rules	R	✓	Firewall Manager
Show statistics	Displays statistics of firewall rules on the BIG-IP system	R	✓	Firewall Manager
<b>Audit Management Services</b>				
View System Audit Logs	Display various service logs	R	✓	Auditor
Export Analytics Logs	Export system analytics logs	W	✓	Auditor
Enable/Disable audition	Enables/Disables system auditing	R	✓	Auditor

Service	Description	Access Type (R, W, Z) Read/Write/Zeroize	Authorization	
			Crypto Officer	User
<b>System Management Services</b>				
Configure Boot Options	Enable Quit boot, manage boot locations	R, W	✓	Resource Manager
Configure SSH access options	Enable/Disable SSH access, Configure IP address whitelist	R, W	✓	None
Configure Firewall Users	Manage firewall rules	R, W	✓	Firewall Manager
Configure nodes and pool members	Enable/Disable nodes and pool members	R, W	✓	Operator
Configure iRules	create, modify, view, and delete iRules	R, W	✓	iRule Manager
Reboot System	Restart cryptographic module	W, Z	✓	Resource Manager
Secure Erase	Full system zeroization	W, Z	✓	None

Table 9 – Management Services in FIPS mode of operation

Table 10 lists the crypto services available in FIPS mode of operation. Here the Control Plane refers to connecting to the device for management and the Data Plane refers to the connection of the device to external entities.

Service	Algorithms / Key Sizes	Role	Keys/CSPs	Interface	
<b>SSH Services</b>				Data Plane	Control Plane
Establish SSH Session	Signature generation and verification: ECDSA with SHA-256/SHA-384 and curve P-256/P-384 RSA with SHA-256/SHA-384 and 2048/3072-bit key size	User CO	RSA/ECDSA Key Pair		Yes
	Key Exchange: EC Diffie-Hellman		EC Diffie-Hellman key pair, shared secret		
	Key Derivation: SP800-135 SSH KDF		Session encryption keys EC Diffie-Hellman shared secret		

Service	Algorithms / Key Sizes	Role	Keys/CSPs	Interface	
Maintain SSH Session	Data Encryption and Decryption: AES (CBC mode)	User CO	Session encryption keys		Yes
	Data Integrity (MAC): HMAC with SHA-1		Session data authentication keys		
Close SSH Session	N/A	User CO	Zeroize session keys and shared secret		Yes
TLS Services				Data Plane	Control Plane
Establish TLS session	Signature Generation and Verification: RSA or ECDSA with SHA-256/SHA-384	User CO	RSA, ECDSA key pairs	Yes	Yes
	Key Exchange: ECDH with SP800-135 TLS KDF, RSA Key wrapping (allowed)		RSA, ECDH Key pair, TLS pre-master secret and master secret	Yes	Yes
Maintaining TLS session	Data Encryption: AES CBC, GCM  Data Authentication: HMAC SHA-1/SHA-256/SHA-384	User CO	AES and HMAC Keys	Yes	Yes
Closing TLS session	N/A	User CO	Session keys, shared secret	Yes	Yes

Table 10 – Crypto Services in FIPS mode of operation

The following tables list all of the non-approved services available in the non-FIPS-Approved mode of operation.

Service	Role	Usage/Notes
TLS Services		
Establishing TLS session	User CO	Signature generation and verification using DSA or RSA/ECDSA with SHA-1/SHA-224/SHA-512 RSA with keys less than 2048

Service	Role	Usage/Notes
		Key Exchange using: Diffie-Hellman RSA Key wrapping with keys less than 2048
Maintain TLS session		Data encryption using Triple-DES Data authentication using HMAC SHA-224/SHA-512
<b>SSH Services</b>		
Establish SSH session	User CO	Signature generation and verification using: DSA, Ed25519 RSA/ECDSA with SHA-1/SHA-224/SHA-512 RSA with key size less than 2048-bit Key exchange using Diffie-Hellman, Ed25519
Maintain SSH session		Data encryption using Triple-DES Data authentication using HMAC SHA-1/SHA-224/SHA-512
<b>Other Services</b>		
IPsec	User CO	The configuration and usage of IPsec is not approved
iControl REST access		Access to the system through REST using non-approved crypto from BouncyCastle
Configuration using SNMP		Management of the module via SNMP is not approved.

Table 11 – Services in non-FIPS mode of operation

## 4. Physical Security

All of the modules listed in *Table 1: Tested Modules* are enclosed in a hard-metallic case that provides obscurity from visual inspection of internal components. Each module is fitted with tamper evident labels to provide physical evidence of attempts to gain access inside the case. The tamper evident labels shall be installed for the module to operate in approved mode of operation. The Crypto Officer is responsible for inspecting the quality of the tamper labels on a regular basis to confirm the modules have not been tampered with. In the event that the tamper evident labels require replacement, a kit providing 25 tamper labels is available for purchase (P/N: F5-ADD-BIG-FIPS140). The Crypto Officer shall be responsible for the storage of any label kits.

Physical Security Mechanism	Recommended Inspection Frequency	Guidance
Tamper Evident Labels	Once per month	Check the quality of the tamper evident labels for any sign of removal, replacement, tearing, etc. If any label is found to be damaged or missing, contact the system administrator immediately.

Table 12 – Inspection of Tamper Evident Labels

### 4.1. Tamper Label Placement

The details below show the location of all tamper evident labels for each module. Label application instructions are provided in the *F5 Platforms: FIPS Kit Installation* guide delivered with each module.

Module	# of Tamper Labels	Module	# of Tamper Labels
BIG-IP i4000	3	BIG-IP 4000	3
BIG-IP i5000	3	BIG-IP 5250v-F	4
BIG-IP i5820-DF	4	BIG-IP 7000	4
BIG-IP i7000	6	BIG-IP 7200v-F	5
BIG-IP i7820-DF	4	BIG-IP 10200v-F	4
BIG-IP i10800	6	BIG-IP 10350v-F	4
BIG-IP i11800-DS	6	VIPRION B2250	6
BIG-IP i15800	5	VIPRION B4450	5

## 5. Operational Environment

### 5.1. Applicability

The module operates in a non-modifiable operational environment per FIPS 140-2 level 2 specifications and as such the operational environment requirements do not apply.

## 6. Cryptographic Key Management

The following table summarizes the CSPs that are used by the cryptographic services implemented in the module:

Name	Generation	Storage	Zeroization
DRBG entropy input string	Obtained from NDRNG.	RAM	Zeroized by device reboot
DRBG V and Key values	Derived from entropy string as defined by [SP800-90A]	RAM	
TLS RSA private key	Generated using FIPS 186-4 Key generation method and the random value used in the key generation is generated using SP800-90A DRBG.	Disk	Zeroized when key file is deleted or by secure erase option at boot.
TLS ECDSA private key		RAM	Zeroized by closing TLS session or by or rebooting the device.
TLS EC Diffie-Hellman private Key			
TLS Pre-Master Secret and Master Secret	Established during the TLS handshake	RAM	Zeroized by closing TLS session or by or rebooting the device.
Derived TLS session key (AES, HMAC)	Derived from the master secret via SP800-135 TLS KDF		
SSH Shared Secret	Established during the SSH handshake	RAM	Zeroized by closing SSH session or terminating the SSH application or rebooting the device.
Derived SSH session key (AES, HMAC)	Derived from the shared secret via SP800-135 SSH KDF	RAM	
SSH EC Diffie-Hellman private Key	Generated using FIPS 186-4 Key generation method and the random value used in the key generation is generated using SP800-90A DRBG.	RAM	
SSH RSA private Key		Disk	Zeroized using ssh-keyswap utility or by secure erase option at boot.
SSH ECDSA private Key			
User Password	Entered by the user	Disk	Zeroized by secure erase option at boot or overwritten when password is changed

Table 13 – Life cycle of CSPs

The following sections describe how CSPs, in particular cryptographic keys, are managed during its life cycle.

### 6.1. Key Generation

The HMAC and AES keys are generated as part of the TLS/SSH protocol when deriving session keys. For generation of RSA and EC keys, the module implements asymmetric key generation services compliant with [FIPS186-4], and using DRBG compliant with [SP800-90A]. A seed (i.e. the random value) used in asymmetric key generation is obtained from [SP800-90A] DRBG. The module does not implement symmetric key generation as an explicit service. The symmetric keys used are derived from shared secret by applying SP 800-135 as part of the TLS/SSH protocol. This scenario maps to the section 7.3 of the SP 800-133 symmetric keys generated using Key agreement scheme. In accordance with FIPS 140-2 IG D.12, the cryptographic module performs Cryptographic Key Generation (CKG) for asymmetric keys as per SP800-133 (vendor affirmed).

## 6.2. Key Establishment

The module provides RSA Key wrapping scheme which is used as part of TLS protocol and EC Diffie-Hellman key agreement scheme which is used as part of the TLS and SSH Protocol with the key derivation implemented by SP 800-135 TLS and SSH KDF. The module also includes a SP 800-38F key wrapping in the context of TLS and SSH protocol where a key may be within a packet or message that is encrypted and authenticated using approved authenticated encryption mode i.e. AES GCM or a combination method which includes approved symmetric encryption algorithm i.e. AES together with approved authentication method i.e. HMAC-SHA. These schemes provide the following security strength in FIPS mode:

- RSA key wrapping provides 112 or 128-bits of encryption strength
- EC Diffie-Hellman key agreement provides 128 or 192-bits of encryption strength
- SP 800-38F key wrapping using approved authenticated encryption mode i.e. AES GCM provides between 128 and 256 bits of encryption strength
- SP 800-38F key wrapping using a combination of approved AES encryption and HMAC authentication method provides between 128 and 256 bits of encryption strength

## 6.3. Key Entry / Output

The module does not support manual key entry or intermediate key generation key output. During the TLS/SSH handshake, the keys that are entered or output to the module over the network, includes RSA/ECDSA public keys and the TLS pre-master secret encrypted with RSA key only when using the RSA key exchange with TLS. For TLS with ECDH key exchange, the TLS pre-master secret is established during key agreement and is not output from the module. Once the TLS/SSH session is established, any key or data transfer performed thereafter is protected by AES encryption.

## 6.4. Key / CSP Storage

As shown in the above table most of the keys are stored in the non-volatile memory in plaintext form and are destroyed when released by the appropriate zeroization calls or the system is rebooted. The keys stored in plaintext in non-volatile memory are static and will remain on the system across power cycle and are only accessible to the authenticated administrator.

## 6.5. Key / CSP Zeroization

The zeroization methods listed in the above Table, overwrites the memory occupied by keys with “zeros”. Additionally, the user can enforce it by performing procedural zeroization. For keys present in volatile memory, calling reboot command will clear the RAM memory. For keys present in non-volatile memory, using secure erase option (can only be triggered by the administrator during reboot of the device) will perform single pass zero write erasing the disk contents.

## 6.6. Random Number Generation

The module employs a Deterministic Random Bit Generator (DRBG) based on [SP800-90A] for the generation of random value used in asymmetric keys, and for providing an RNG service to calling applications. The Approved DRBG provided by the module is the CTR\_DRBG with AES-256. The DRBG is initialized during module initialization.

The module uses a Non-Deterministic Random Number Generator (NDRNG) to seed the DRBG. A Continuous Random Number Generation Test (CRNGT) is performed on the output of the NDRNG prior to seeding the DRBG and also on the DRBG output. The NDRNG provides at least 256- bits of entropy to the DRBG during initialization (seed) and reseeding (reseed). The NDRNG is within its physical boundary.

## 7. Self-Tests

### 7.1. Power-Up Tests

The module performs power-up tests automatically during initialization when the device is booted without requiring any operator intervention; power-up tests ensure that the module's firmware is not corrupted and that the cryptographic algorithms work as expected.

During the execution of power-up tests, services are not available and input and output are inhibited. Upon successful completion of the power-up tests, the module is initialized and enters operational mode where it is accessible for use. If the module fails any of the power-up tests, it enters into the 'Halt Error' state and halts the system. In this state, the module will prohibit any data outputs and cryptographic operations and will not be available for use. The module will be marked unusable and the administrator will need to reinstall the module to continue.

#### 7.1.1. Integrity Tests

The integrity of the module is verified by comparing the MD5 checksum value of the installed binaries calculated at run time with the stored value computed at build time. If the values do not match the system enters halt error state and the device will not be accessible. In order to recover from this state, the module needs to be reinstalled.

#### 7.1.2. Cryptographic algorithm tests

The module performs self-tests on all FIPS-Approved cryptographic algorithms supported in the approved mode of operation and is done on the Data plane as well as Control Plane side, using the Known Answer Test (KAT) and Pair-wise Consistency Test (PCT) as listed in the following table:

Algorithm	Test
<b>Control Plane Self-tests</b>	
CTR_DRBG	<ul style="list-style-type: none"> <li>KAT using AES 256-bit with and without derivation function</li> </ul>
AES	<ul style="list-style-type: none"> <li>KAT of AES encryption with ECB mode and 128-bit key</li> <li>KAT of AES decryption with ECB mode and 128-bit key</li> </ul>
RSA	<ul style="list-style-type: none"> <li>KAT of RSA PKCS#1 v1.5 signature generation with 2048 bit key and SHA-256</li> <li>KAT of RSA PKCS#1 v1.5 signature verification with 2048 bit key and SHA-256</li> </ul>
ECDSA	<ul style="list-style-type: none"> <li>PCT of ECDSA signature generation and verification with P-256 curve</li> </ul>
EC Diffie-Hellman	<ul style="list-style-type: none"> <li>primitive "Z" computation KAT with P-256 curve</li> </ul>
SHA-1, SHA-256, SHA-384	<ul style="list-style-type: none"> <li>KAT of SHA-1</li> <li>KAT of SHA-256</li> <li>KAT of SHA-384 is covered by KAT for HMAC-SHA-384</li> </ul>

Algorithm	Test
HMAC-SHA-1, HMAC-SHA-256, HMAC-SHA-384	<ul style="list-style-type: none"> <li>• KAT of HMAC-SHA-1</li> <li>• KAT of HMAC-SHA-256</li> <li>• KAT of HMAC-SHA-384</li> </ul>
<b>Data Plane Self-Tests</b>	
AES	<ul style="list-style-type: none"> <li>• KAT of AES encryption with CBC mode and 128-bit key</li> <li>• KAT of AES decryption with CBC mode and 128-bit key</li> </ul>
RSA	<ul style="list-style-type: none"> <li>• KAT of RSA PKCS#1 v1.5 signature generation with 2048 bit key and SHA-256</li> <li>• KAT of RSA PKCS#1 v1.5 signature verification with 2048 bit key and SHA-256</li> </ul>
ECDSA	<ul style="list-style-type: none"> <li>• PCT of ECDSA signature generation and verification with P-256 curve</li> </ul>
EC Diffie-Hellman	<ul style="list-style-type: none"> <li>• primitive “Z” computation KAT with P-256 curve</li> </ul>
CTR_DRBG	<ul style="list-style-type: none"> <li>• Covered by Data Plane Self-Tests. (Control Plane makes use of the same DRBG implementation provided by Data Plane)</li> </ul>
HMAC-SHA-1, HMAC-SHA-256, HMAC-SHA-384	<ul style="list-style-type: none"> <li>• KAT of HMAC-SHA-1</li> <li>• KAT of HMAC-SHA-256</li> <li>• KAT of HMAC-SHA-384</li> </ul>
SHA-1, SHA-256, SHA-384	<ul style="list-style-type: none"> <li>• Covered by respective HMAC KATs</li> </ul>

Table 14 – Self-Tests

## 7.2. On-Demand self-tests

The module does not explicitly provide the Self-Test service to perform on demand self-tests. On demand self-tests can be invoked by powering-off and powering-on the system in order to initiate the same cryptographic algorithm tests executed during power-up. During the execution of the on-demand self-tests, crypto services are not available and no data output or input is possible.

## 7.3. Conditional Tests

The module performs conditional tests on the cryptographic algorithms shown in the following table. If the module fails any of these tests, the device reboots and enters into the Halt Error state prohibiting any data output or cryptographic operations and the module will be inoperable. The module must be re-installed in order to clear the error condition.

<b>Algorithm</b>	<b>Test</b>
DRBG	<ul style="list-style-type: none"><li>• Continuous random number generator test (CRNGT) on the output of the DRBG</li></ul>
NDRNG	<ul style="list-style-type: none"><li>• Continuous random number generator test (CRNGT) on the output of the NDRNG prior to seeding the CTR_DRBG</li></ul>
RSA key generation	<ul style="list-style-type: none"><li>• Pair-wise Consistency Test (PCT) using SHA-256</li></ul>
ECDSA key generation	<ul style="list-style-type: none"><li>• Pair-wise Consistency Test (PCT) using SHA-256</li></ul>

*Table 15 – Conditional Tests*

## 8. Guidance

### 8.1. Delivery and Operation

The module is distributed as a part of a BIG-IP product which includes the hardware and an installed copy of 13.1.1 EHF For FIPS compliance, the following steps defined in section 8.2 should be completed by the Crypto Officer prior to access to the device is allowed.

### 8.2. Crypto Officer Guidance

#### 8.2.1. Installing Tamper Evident Labels

Before the device is installed in the production environment, tamper-evident labels must be installed in the location identified for each module in section 4.1. The following steps should be taken when installing or replacing the tamper evident labels on the module. The instructions are also included in *F5 Platforms: FIPS Kit Installation* provided with each module.

- Use the provided alcohol wipes to clean the chassis cover and components of dirt, grease, or oil before you apply the tamper evidence seals.
- After applying the seal, run your finger over the seal multiple times using extra high pressure.
- The seals completely cure within 24 hours.

It is the responsibility of the Crypto Officer to inspect the tamper evident labels for damage or any missing labels as specified in Section 4.

#### 8.2.2. Install Device

- Follow the instructions in the "*BIG-IP System: Initial Configuration*" guide for the initial setup and configuration of the device.
- Add the FIPS license when prompted during the GUI setup wizard.

#### 8.2.3. Password Strength Requirement

The Crypto officer must modify the BIG-IP password policy to meet or exceed the requirements defined in Table 8 – Authentication of Roles. Instructions for this can be found in the "*BIG-IP System: User Account Administration*" guide. After assuming the role for the first time, the Crypto Officer shall replace the default password with one matching the password policy. For SSH authentication the Crypto officer must configure the SSH to allow only password-based authentication.

#### 8.2.4. Additional Guidance

The Crypto Officer should verify that the following specific configuration rules are followed in order to operate the module in the FIPS validated configuration:

- All command shells other than tmsh are not allowed. For example, bash and other user-serviceable shells are excluded.
- Management of the module via the appliance's LCD display is not allowed.
- Usage of f5-rest-node and iAppLX and provisioning of iRulesLX is not allowed.
- Only the provisioning of AFM and LTM is included.

- Remote access to the Lights Out / Always On Management capabilities of the system are not allowed.
- Serial port console should be disabled after the initial power on and communications setup of the hardware.
- On the i11800-DS device, the Cavium Nitrox-V must be disabled using `lspci | grep -i encryption | awk '{print "device exclude " $1;}' > tmm_init.tcl` command since full support is not available:

## 8.2.5. Version Configuration

Once the device is installed, licensed and configured, the Crypto Officer should confirm that the system is installed and licensed correctly.

### 8.2.5.1. Version Confirmation

The Crypto Officer should run the command "tmsh show sys version", then verify the version shown with the approved version from Table 1 - Tested Modules. Any firmware loaded into the module other than version 13.1.1 EHF is out of the scope of this validation and will mean that the module is not operating as a FIPS validated module.

### 8.2.5.2. License Confirmation

The FIPS validated module activation requires installation of the license referred as 'FIPS license'. The Crypto Officer should run the command "tmsh show sys license", then verify that the list of license flags includes the "FIPS 140-2 Compliant Mode".

## 8.3. User Guidance

- The module supports two modes of operation. *Table 10 – Crypto Services in FIPS mode of operation* list the FIPS approved services and *Table 11 – Services in non-FIPS mode of operation* lists the non-FIPS approved services. Using the services in *Table 4 – Non-FIPS Approved Algorithms/Modes* means that the module operates in non-FIPS Approved mode for the particular session of a particular service, where the non-FIPS approved algorithm or mode was selected.
- AES-GCM IV is constructed in accordance with SP800-38D in compliance with IG A.5 scenario 1. In case the module's power is lost and then restored, the key used for the AES GCM encryption or decryption shall be re-distributed. The AES GCM IV generation is in follows [RFC5288] and shall only be used for the TLS protocol version 1.2 to be compliant with [FIPS140-2\_IG] IG A.5; thus, the module is compliant with [SP800-52].

## 9. Mitigation of Other Attacks

The module does not implement security mechanisms to mitigate other attacks.
