#### 1 Introduction

#### **1.1 About FIPS 140**

Federal Information Processing Standards Publication 140-2 — Security Requirements for Cryptographic Modules specifies requirements for cryptographic products to be deployed in a Sensitive but Unclassified environment. The National Institute of Standards and Technology (NIST) and Canadian Centre for Cyber Security (CCCS) Cryptographic Module Validation Program (CMVP) owns the FIPS 140 program. The CMVP accredits independent testing labs to perform FIPS 140 testing; the CMVP also validates test reports for all products pursuing FIPS 140 validation. *Validation* is the term given to a product that is documented and tested against the FIPS 140 criteria.

More information is available on the CMVP website at https://csrc.nist.gov/projects/testing-laboratories

#### 1.2 About this Document

This non-proprietary Cryptographic Module Security Policy for the Embedded Module and Embedded Module Lite provides an overview of the product and a high-level description of how it meets the security requirements of FIPS 140-2. This document contains details on the module's cryptographic keys and critical security parameters. This Security Policy concludes with instructions and guidance on running the modules in a FIPS 140-2 mode of operation.

The Embedded Module and Embedded Module Lite may also be referred to as the "module" in this document.

#### 1.3 External Resources

The Persistent Systems website (<a href="http://www.persistentsystems.com">http://www.persistentsystems.com</a>) contains information on the full line of products from Persistent Systems, including a detailed overview of the Embedded Module and Embedded Module Lite. The Cryptographic Module Validation Program website (<a href="https://csrc.nist.gov/Projects/Cryptographic-Module-Validation-Program">https://csrc.nist.gov/Projects/Cryptographic-Module-Validation-Program</a>) contains links to the FIPS 140-2 certificate and Persistent Systems contact information.

#### 1.4 Notices

This document may be freely reproduced and distributed in its entirety without modification.

# 1.5 Acronyms

The following table defines acronyms found in this document:

| Acronym | Term                                |
|---------|-------------------------------------|
| AES     | Advanced Encryption Standard        |
| DRBG    | Deterministic Random Number         |
|         | Generator                           |
| CCCS    | Canadian Centre for Cyber Security  |
| CSP     | Critical Security Parameter         |
| DTR     | Derived Testing Requirement         |
| FIPS    | Federal Information Processing      |
|         | Standard                            |
| FTL     | Flash Translation Layer             |
| GUI     | Graphical User Interface            |
| HMAC    | Keyed-Hash Message Authentication   |
|         | Code                                |
| KAT     | Known Answer Test                   |
| MANET   | Mobile Ad-hoc Network               |
| MPU     | Man Portable Unit                   |
| NIST    | National Institute of Standards and |
|         | Technology                          |
| NDRNG   | Non Deterministic Random Number     |
|         | Generator                           |
| PCT     | Pairwise Consistency Test           |
| SHA     | Secure Hashing Algorithm            |

Table 1 – Acronyms and Terms

## 2 Persistent Systems Embedded Module and Embedded Module Lite

#### 2.1 Wave Relay® Product Overview

The Wave Relay® System is a peer-to-peer wireless MANET networking solution in which there is no master node. If any device fails, the rest of the devices continue to communicate using any remaining connectivity. By eliminating master nodes, gateways, access points, and central coordinators from the design, Wave Relay® delivers high levels of fault tolerance regardless of which nodes might fail. The system is designed to maximize the capacity of the radio frequency (RF) spectrum and to minimize the network overhead. While optimizing efficiency, Wave Relay® also implements techniques that increase multicast reliability. The advanced multicast functionality allows the system to support both multicast voice and video over IP.

Wave Relay® is designed to maintain high bandwidth connectivity among devices that are on the move. The system is scalable, enabling it to incorporate unlimited meshed devices into the wireless network, where the devices themselves form the communication infrastructure. Even in highly dynamic environments, the system is able to maintain connectivity by rapidly re-routing data as necessary. Wave Relay® is a self-forming and self-healing network where nodes can move freely within the network. Critical information flows reliably throughout the network while individual data paths are able to adapt at sub-second intervals. This unique approach creates an ideal environment for maximizing performance across the available communications medium. Customers leverage Wave Relay®'s straight forward and effective architecture to enable a true "Plug and Play" capability. Deploying a Wave Relay® network is as simple as connecting a standard Ethernet cable; customers are immediately connected to everything on the network.

Wave Relay® is a seamless wireless networking system offering a dynamic and reliable solution for all mobile networking needs The Persistent Systems Embedded Module and Embedded Module Lite offers the Wave Relay® MANET combined with other leading-edge technologies in a single smart radio.

## 2.2 Cryptographic Module Specification

The module is the Embedded Module HW P/N WR-5200 Version 4.0, 6.0, 7.0, and 12.B and the Embedded Module Lite HW P/N WR-5250 Version 1.0, 3.0, and 12.B. The Embedded Module Lite is identical to the Embedded Module, except for the following:

- Audio: Codec and connectors for Microphone and Speaker were removed
- Accelerometer/Gyroscope (IMU) were removed
- Flash memory is reduced from 128GB to 32GB
- HDMI Video input chip, supporting hardware and connector were removed
- SDI Video input chip, supporting hardware and MMCX connector were removed
- Analog video input was removed
- GPS chip, supporting hardware and MMCX connector were removed

The module uses FW Version 19.5.5 and 19.6.4. Each module is a multiple-chip embedded embodiment.

The physical cryptographic boundary is defined as the module board with heat-sinks, which includes the Wave Relay® main board, including the hardware cryptographic accelerator chip, drivers, CPU, and onboard flash memory. The boundary does not include the radio module or power supply.

Figure 1 - Physical Boundary of Embedded Module

Figure 2- Two Tamper-Evident Seals on sides of Embedded Module

Figure 3 – Physical Boundary of Embedded Module Lite

Figure 4 – Two Tamper-Evident Seals on sides of Embedded Module Lite

The module is in FIPS-approved mode of operation when the validated firmware is used and when the guidance in Section 3.1 is adhered to. It does not have any bypass capability. The module does <u>not</u> support a non-Approved mode.

#### 2.2.1 Validation Level Detail

The following table lists the level of validation for each area in FIPS 140-2:

| FIPS 140-2 Section Title                       | Validation Level |
|--|------------------|
| Cryptographic Module Specification             | 1                |
| Cryptographic Module Ports and Interfaces      | 1                |
| Roles, Services, and Authentication            | 2                |
| Finite State Model                             | 1                |
| Physical Security                              | 2                |
| Operational Environment                        | 1                |
| Cryptographic Key Management                   | 1                |
| Electromagnetic Interference / Electromagnetic | 1                |
| Compatibility                                  |                  |
| Self-Tests                                     | 1                |
| Design Assurance                               | 3                |
| Mitigation of Other Attacks                    | N/A              |
| Overall Level                                  | 1                |

Table 2 - Validation Level by DTR Section

## 2.2.2 Algorithm Implementation Certificates

The Embedded Module's cryptographic algorithm implementations have received the following certificate numbers from the Cryptographic Algorithm Validation Program:

| Algorithm Type | Algorithm                        | Standard   | CAVP<br>Cert. | Use               |
|----------------|----------------------------------|------------|---------------|-------------------|
| Symmetric Key  | AES- {128*, 192*, 256} in {CBC*, | FIPS 197   | Cert.         | Data encryption / |
|                | CTR, ECB*} mode                  |            | #4456         | decryption        |
| Keyed Hash     | HMAC-SHA-{1, 224*, 256}          | FIPS 198   | Cert.         | Message integrity |
|                |                                  |            | #2957         |                   |
| Hashing        | SHA- {1, 224*, 256}              | FIPS 180-4 | Cert.         | Message digest    |
|                |                                  |            | #3668         |                   |

Table 3 – Algorithm Certificates for Wave Relay® E2 Cryptographic Engine

<sup>\*</sup> Denotes that the algorithm, mode of operation, and/or key size is not used/accessible

| Algorithm Type | Algorithm                         | Standard   | CAVP<br>Cert. | Use               |
|----------------|-----------------------------------|------------|---------------|-------------------|
| Symmetric Key  | AES- {128*, 192*, 256*} in {CBC*, | FIPS 197   | Cert.         | Not currently     |
|                | CTR*, GCM*, ECB*} mode            |            | #4454         | used/accessible   |
| Symmetric Key  | AES- {128*, 256*} in {XTS*} mode  | FIPS 197   | Cert.         | Not currently     |
|                |                                   |            | #4454         | used/accessible   |
| Keyed Hash     | HMAC-SHA-{1*, 224*, 256*, 384*,   | FIPS 198   | Cert.         | Message integrity |
|                | 512}                              |            | #2955         |                   |
| Hashing        | SHA-{1*, 224*, 256*, 384*, 512}   | FIPS 180-4 | Cert.         | Message digest    |
|                |                                   |            | #3666         |                   |

-

<sup>&</sup>lt;sup>1</sup> The module is compatible with TLSv1.2 and provides support for the acceptable GCM cipher suites from SP 800-52 Rev1, Section 3.3.1. The counter portion of the IV is set by the module within its cryptographic boundary. When the IV exhausts the maximum number of possible values for a given session key, the first party, client or server, to encounter this condition will trigger a handshake to establish a new encryption key. In case the module's power is lost and then restored, a new key for use with the AES GCM encryption/decryption shall be established.

Table 5 – Algorithm Certificates for Wave Relay® Cryptographic Library

The following non-approved, but allowed protocols/algorithms are available in FIPS mode of operation:

- EC Diffie-Hellman (CVL Cert. #1161 with CVL Cert. #1163, key agreement; key establishment methodology provides 192 bits of encryption strength)
- MD5 within TLS only\*
- Hardware non-deterministic random number generator (NDRNG) (allowed for seeding FIPSapproved DRBG)
- RSA (key wrapping; key establishment methodology provides 112 bits of encryption strength)

#### 2.3 Module Interfaces

The interfaces for the cryptographic boundary include physical and logical interfaces. The physical interfaces provided by the module are mapped to five FIPS 140-2 defined logical interfaces: Data Input, Data Output, Control Input, Status Output, and Power. The mapping of logical interfaces to module physical interfaces is provided in the following table:

<sup>\*</sup> Denotes that the algorithm, mode of operation, and/or key size is not used/accessible

<sup>\*</sup> No security is claimed from the use of these protocols/algorithms.

FIPS 140-2 Non-Proprietary Security Policy: Persistent Systems Wave Relay® Embedded Module and Embedded Module Lite

| Module Physical Interface (Port) | FIPS 140-2 Logical Interface                             | Embedded<br>Module | Embedded<br>Module<br>Lite |
|----------------------------------|--|--------------------|----------------------------|
| HDMI Video In                    | Data Input   | X                  |                            |

Table 6 – Logical Interface / Physical Interface Mapping

## 2.4 Roles, Services, and Authentication

The module only supports a FIPS-Approved mode. The module is accessed via Web browser over HTTPS/TLS. As required by FIPS 140-2, the module supports a Crypto Officer role and a User role. The module supports role-based authentication, and the respective services for each role are described in the following sections.

Both roles can access all services in the module. The module does not support a Maintenance role. The "Unauthenticated" role indicates services that the module performs automatically after POST and services that an operator may perform without authentication.

# 2.4.1 Operator Services and Descriptions

The services available to roles in the modules are as follows:

| Service              | Description   | Roles                  | CSPs  |
|----------------------|---|------------------------|---|
| Power-On             | Provides power and initializes the module. TLS key pairs are generated if                                 | Unauthenticated        | Use Module Integrity<br>Key                             |
|                      | unit was previously zeroized.   |                        | Use Store Key   |
|                      |   |                        | Use/Zeroize DRBG entropy input                          |
|                      |   |                        | Use/Zeroize DRBG V                                      |
|                      |   |                        | Use/Zeroize DRBG<br>Key                                 |
|                      |   |                        | Generate/Use/Zeroize<br>CA Private Key                  |
|                      |   |                        | Generate/Use/Zeroize<br>CA Public Key                   |
|                      |   |                        | Generate TLS ECDSA<br>Private Key                       |
|                      |   |                        | Generate TLS ECDSA<br>Public Key                        |
|                      |   |                        | Generate TLS RSA<br>Private Key                         |
|                      |   |                        | Generate TLS RSA<br>Public Key                          |
|                      |   |                        | Generate TLS Pre-<br>master Secret (All<br>Cases)       |
|                      |   |                        | Generate TLS Master<br>Secret/Traffic Keys <sup>2</sup> |
| Packet<br>Forwarding | Provides packet forwarding and receipt. Forwarded packets are encrypted and                               | Crypto Officer<br>User | Use MANET<br>Encryption Key                             |
|                      | signed, and incoming packets are decrypted and verified   |                        | Use MANET<br>Authentication Key                         |
| Management           | Provides configuration and password management functions over TLS such as setting and deleting a password | Crypto Officer<br>User | Write/Use/Zeroize<br>Operator Passwords                 |

 $^{2}$  "Traffic Keys" refer to the MANET Encryption Key and MANET Authentication Key listed in Table 8.

FIPS 140-2 Non-Proprietary Security Policy: Persistent Systems Wave Relay® Embedded Module and Embedded Module Lite

| Service              | Description   | Roles                  | CSPs  |
|----------------------|---|------------------------|---|
| TLS                  | Establishes and maintains TLS connections   | Crypto Officer<br>User | Generate/Use/Zeroize DRBG entropy input                                     |

| Application<br>Loading | The operating system is modifiable and allows the operator to load and execute software that was not included as part of                    | Crypto Officer<br>User              | N/A   |
|                        | the original validation.  | Unauthenticated                     |   |

Table 7 – Operator Services and Descriptions

The module does not support multiple concurrent operators. Each "view" or "set" of configuration by a user is a separate action, and the actual configuration is determined by the latest "set." The Web GUI will indicate that a User/Crypto Officer role has logged themselves in. Only one operator can configure the module at one time. In the event that two authenticated sessions exist at one time for configuration, the module will save/store the parameters of the last operation. Concurrent sessions are treated as an individual session, but from separate end points.

#### 2.4.2 Operator Authentication

Crypto Officer and User password must be a minimum of 8 characters. Legal password characters are the set of all 95 printable ASCII characters. This includes a-z, A-Z, 0-9, space, and these special characters:  $!"\#\$\%\&"()*+,-./:;<=>?@[\]^_`{|}~.$  Passwords are case-sensitive. Given a random password of eight characters using the full character set, the probability of a successful random attempt is  $1/95^8$ , which is dramatically less than the 1/1,000,000 requirement. There is an explicit limit employed by the module to dramatically slow down the effective speed of an online brute force guessing attack. The system keeps tracks of recent failed attempts. If this count reaches ten, the system no longer accepts authentication attempts and the system reduces this count by one every ten seconds. As a result, a maximum of 16 guesses can be attempted in a one minute interval. This assumes that there are no failed guesses in the prior 100 seconds, ten guesses are made immediately at the beginning of the minute, and then followed by one guess every ten seconds for the remainder of the minute. Given a random password of eight characters using the full character set, this reduces the probability of success to  $16/95^8$ , which is dramatically less than 1/100,000 requirement.

#### 2.5 Physical Security

The physical security of the cryptographic module meets FIPS 140-2 Level 2 requirements. The cryptographic module consists of production-grade components and includes an opaque enclosure protected by tamper evident seals. The two (2) tamper-evident seals are applied to the sides of the module by the manufacturer (see Figures 2 and 4). The physical boundary of the cryptographic module is the same as the physical boundary of the device.

The module does not include a maintenance interface; therefore, the FIPS-140-2 maintenance mode requirements do not apply.

#### 2.6 Operational Environment

The module supports a modifiable operational environment. The module's firmware can only be updated with the verification of a digital signature over the firmware to be loaded. In addition, the operator may load and execute software that was not included in the original validation as the underlying operational environment is modifiable.

# 2.7 Cryptographic Key Management

The table below provides a complete list of Critical Security Parameters and Public Keys used within the module:

| Key/CSP<br>Name                 | Description / Use  | Generation /<br>Establishment                               | Storage   | Import/Export   | Destructio<br>n                                  |
|---------------------------------|--|---|---|---|--|
| MANET<br>Encryption<br>Key      | AES CTR mode with<br>256-bit key for<br>encryption /<br>decryption of network<br>traffic   | Internal<br>generation by<br>DRBG or<br>imported via<br>TLS | Storage: Flash in encrypted form by the Store Key  Association: The system is the one and only owner. Relationship is maintained by the operating environment via protected memory. | Agreement: NA  Entry: Electronic Key Entry via TLS  Output: via TLS                       | Destroyed<br>by<br>zeroizing<br>the Store<br>Key |
| MANET<br>Authenticat<br>ion Key | Minimum key size of 256 bits. Maximum key size is the size of the block algorithm used. HMAC-SHA1 and HMAC-SHA256 has a block size of 512. HMAC-SHA512 has a block size of 1024 bits. This key is used for message verification and integrity check. | Internal<br>generation by<br>DRBG or<br>imported via<br>TLS | Storage: Flash in encrypted form by the Store Key   | Agreement: NA  Entry: Electronic Entry via TLS  Output: via TLS                           | Destroyed<br>by<br>zeroizing<br>the Store<br>Key |
| Module<br>Integrity<br>Key      | HMAC SHA-256 key<br>for verifying the<br>integrity of the<br>module. Fixed string<br>of 43 characters.   | Not generated<br>by the module;<br>built into<br>firmware   | Storage: Flash in plaintext  Type: Static   | Agreement: NA  Entry: FW upgrade encrypted by Firmware Decryption Key and TLS  Output: NA | Replaced<br>during FW<br>upgrade                 |

Table 8 – Key/CSP Management Details (also includes public keys)

Network Keys can be exported from the physical boundary of the module when the Crypto Officer rekeys the module using the network management feature. The Network Key will be sent to other nodes (modules) on the network encrypted with TLS.

All persistent keys and CSPs are stored in an encrypted store. This store is located in eMMC and is encrypted via an AES 256-bit key (Store Key). The key & IV used to encrypt the store are stored in a separate flash without FTL. Zeroization has been implemented to ensure no traces are left of the store key & IV. Zeroization is achieved by explicitly erasing the flash sector, containing the key and IV material. The erase operation is at the hardware level and writes a specific value to flash. The Embedded Module can be zeroized by switching the zeroized pin, in the control port, to ground (requires main power to be connected to a power source), or via the management interface by an authorized role (requires unit to be on and operational).

#### 2.8 Self-Tests

The module includes an array of self-tests that are run during startup and periodically during operations to prevent secure data from being released and to ensure all components are functioning correctly. In the event of any self-test failure, the module will restart. Self-test Success status is indicated by the status LED as well as via HTTPS. No keys or CSPs will be output when the module is in an error state.

If the self-tests succeed, the operator will be presented with a login screen when accessing the module via HTTPS. Attempts to access it via HTTP will be automatically redirected to HTTPS. If the self-tests fail, any attempt to access the module will fail.

Since the module only supports a FIPS-approved mode of operation, the self-tests are always run. On failure, the module will always be non-operational as there is no non-FIPS or bypass mode available.

The following sections discuss the module's self-tests in more detail.

#### 2.8.1 Power-On Self-Tests

Power-on self-tests are run upon every initialization of the module and if any of the tests fail, the process will be halted and the module will not initialize. In this error state, no services can be accessed by the users. The module implements the following power-on self-tests:

| Hardware Implementation (Cryptographic Engine) |   |  |
|--|---|--|
| Test Target                                    | Description                             |  |
| AES  | KATs: Encryption, Decryption            |  |
|  | Modes: CBC, CTR, ECB                    |  |
|  | Key sizes: 128-bits, 192-bits, 256-bits |  |
| SHS  | KATs: Output Verification               |  |

| НМАС  | KATs: Generation, Verification                       |  |  |
|   | SHA sizes: SHA-1, SHA-224, SHA-256, SHA-384, SHA-512 |  |  |

Table 11 - Cryptographic Library POST

The module performs all power-on self-tests automatically when it is initialized. The module also verifies its integrity using HMAC-SHA256. Successful completion of self-tests will be indicated via HTTPS. All power-on self-tests must be passed before a User/Crypto Officer can perform services. The Power-on self-tests can be run on demand by restarting the module.

#### 2.8.2 Conditional Self-Tests

Conditional self-tests are run continuously when certain conditions are met during operation of the module. The module performs the following conditional self-tests:

| Conditional Self-Tests             |                                    |                             |  |
|------------------------------------|------------------------------------|-----------------------------|--|
| Test Target                        | Condition                          | Description                 |  |
| RSA                                | On each generation of a key pair   | Pairwise consistency test   |  |
| DSA                                | On each generation of a key pair   | Pairwise consistency test   |  |
| ECDSA                              | On each generation of a key pair   | Pairwise consistency test   |  |
| DRBG                               | On output of DRBG implementation   | Continuous test             |  |
| NDRNG                              | On output of NDRNG (seed for DRBG) | Continuous test             |  |
| RSA digital signature verification | Firmware Load / Firmware Upgrade   | Signature verification test |  |
| DRBG                               | SP800-90A Health Tests             | Health Checks               |  |

Table 12 - Conditional Self-Tests

Note that the module performs conditional tests for firmware and software implementations of the algorithms listed in the Algorithm Implementation Certificates section. If any of these tests fail, the module will enter an error state. The module can be re-initialized to clear the error and resume FIPS mode of operation. While in an error state, no services can be accessed by the operators.

#### **2.9 EMI/EMC**

The module meets Federal Communications Commission (FCC) FCC Electromagnetic Interference (EMI) and Electromagnetic Compatibility (EMC) requirements for a radio.

# **2.10 Mitigation of Other Attacks**

The module does not mitigate other attacks.

## 3 Guidance and Secure Operation

This section describes how to configure the module for FIPS-approved mode of operation. Operating it without maintaining the following settings will violate the FIPS-approved mode of operation.

### 3.1 Crypto Officer and User Guidance

#### 3.1.1 Initialization for FIPS Mode of Operation

The Crypto Officer or User must configure and enforce the following procedures:

- 1. When setting the password, the Crypto Officer or User must select passwords with a minimum length of eight legal characters, which is enforced by the module. Legal password characters are the set of all 95 printable ASCII characters. This includes a-z, A-Z, 0-9, space, and these special characters: ! "#\$%&' () \*+, -./:; <=>?@[\]^ `{|}~.
  - Note: Stronger, more secure passwords should have a combination of letters and numbers and should not contain any recognizable words that may be found in a dictionary. The module does not enforce this; the Crypto Officer or User must follow his/her organization's systems security policies and adhere to the password policies set forth therein.
- 2. Ensure FW version running is listed in section 2.2 of this document.

#### 3.1.2 General Crypto Officer and User Guidance

After initialization for FIPS mode, the Crypto Officer and User should follow the guidance below:

- 1. When entering a network key over the configuration GUI, the operator must ensure the key was generated by FIPS-approved methods and that the key was not previously used.
- 2. The operator must ensure that all Radio MAC addresses used in a network are unique.
- 3. The Crypto Officer or User must not disclose passwords and must store passwords in a safe location and according to his/her organization's systems security policies for password storage.
