

# Nvidia Corporation

## H100 Tensor Core GPU

Hardware Models: H100 FIPS-1; H100 FIPS-2

Firmware Version: 570.36

## FIPS 140-3 Non-Proprietary Security Policy

FIPS Security Level: 2

Document Version: 0.12

## **References**

This document deals only with operations and capabilities of the module in the technical terms of a FIPS 140-3 cryptographic module security policy. More information is available on the module from the following sources:

- The Nvidia website [www.nvidia.com](http://www.nvidia.com) contains information on the full line of services and solutions from Nvidia.
- The search page on the CMVP website (<https://csrc.nist.gov/Projects/cryptographic-module-validation-program/Validated-Modules/Search>) can be used to locate and obtain vendor contact information for technical or sales-related questions about the module.

## **Document Organization**

*ISO/IEC 19790* Annex B uses the same section naming convention as *ISO/IEC 19790* section 7 - Security requirements. For example, Annex B section B.2.1 is named “General” and B.2.2 is named “Cryptographic module specification,” which is the same as *ISO/IEC 19790* section 7.1 and section 7.2, respectively. Therefore, the format of this Security Policy is presented in the same order as indicated in Annex B, starting with “General” and ending with “Mitigation of other attacks.” If sections are not applicable, they have been marked as such in this document.

# 1. General

---

## 1.1 Overview

This is a non-proprietary Cryptographic Module Security Policy for the H100 Tensor Core GPU (version: 570.36) from Nvidia Corporation (Nvidia). This Security Policy describes how the H100 Tensor Core GPU meets the security requirements of Federal Information Processing Standards (FIPS) Publication 140-3, which details the U.S. and Canadian government requirements for cryptographic modules. More information about the FIPS 140-3 standard and validation program is available on the National Institute of Standards and Technology (NIST) and the Canadian Centre for Cyber Security (CCCS) Cryptographic Module Validation Program (CMVP) website at <http://csrc.nist.gov/groups/STM/cmvp>.

This document also describes how to run the module in a secure Approved mode of operation. This policy was prepared as part of the Level 2 FIPS 140-3 validation of the module. The H100 Tensor Core GPU is referred to in this document as H100 or the module.

## 1.2 Security Levels

The H100 Tensor Core GPU is validated at the FIPS 140-3 section levels shown in the table below.

| Section | Title                                   | Security Level |
|---------|-----------------------------------------|----------------|
| 1       | General                                 | 2              |
| 2       | Cryptographic module specification      | 2              |
| 3       | Cryptographic module interfaces         | 2              |
| 4       | Roles, services, and authentication     | 2              |
| 5       | Software/Firmware security              | 2              |
| 6       | Operational environment                 | N/A            |
| 7       | Physical security                       | 2              |
| 8       | Non-invasive security                   | N/A            |
| 9       | Sensitive security parameter management | 2              |
| 10      | Self-tests                              | 2              |
| 11      | Life-cycle assurance                    | 2              |
| 12      | Mitigation of other attacks             | N/A            |
|         | Overall Level                           | 2              |

**Table 1: Security Levels**

The module has an overall security level of 2.

## 2. Cryptographic Module Specification

---

### 2.1 Description

#### 2.1.1 Purpose and Use

H100 is part of the complete NVIDIA data center solution that incorporates building blocks across hardware, networking, software, libraries, and optimized AI models and applications from the NVIDIA NGC™ catalog. The second-generation Multi-Instance GPU (MIG), built-in NVIDIA confidential computing, and NVIDIA NVLink Switch System allows the H100 to securely accelerate workloads.

#### 2.1.2 Module Type

The H100 Tensor Core GPU 570.36 is a Hardware module.

#### 2.1.3 Module Embodiment

The H100 Tensor Core GPU is a Single Chip embodiment.

#### 2.1.4 Module Characteristics

The module does not have any additional characteristics.

#### 2.1.5 Cryptographic Boundary

The cryptographic boundary of the module is defined by the external edge of the chip casing.

Figure 1 illustrates a block diagram of the H100 GPU.

Figure 1: Module Block Diagram (with Cryptographic Boundary)

Figure 2 and Figure 3 below display the top and bottom views of the module, respectively.

Figure 2: Nvidia H100 Tensor Core GPU (Top View)

Figure 3: Nvidia H100 Tensor Core GPU (Bottom View)

## 2.2 Tested and Vendor Affirmed Module Version and Identification

### 2.2.1 Tested Module Identification – Hardware

The table below displays the tested operational environment of the hardware module.

| Model and/or Part Number | Hardware Version | Firmware Version | Processors  | Features |
|--------------------------|------------------|------------------|-------------|----------|
| H100 FIPS-1              | H100 FIPS-1      | 570.36           | Nvidia H100 | HBM2E    |
| H100 FIPS-2              | H100 FIPS-2      | 570.36           | Nvidia H100 | HBM3     |

Table 2: Tested Module Identification – Hardware

## 2.2.2 Tested Module Identification – Software, Firmware, Hybrid (Executable Code Sets)

This section is only applicable to software, firmware, and hybrid modules.

N/A for this module.

## 2.2.3 Tested Module Identification – Hybrid Disjoint Hardware

This section is only applicable to hybrid modules.

N/A for this module.

## 2.2.4 Tested Operational Environments – Software, Firmware, Hybrid

This section is only applicable to software, firmware, and hybrid modules.

N/A for this module.

## 2.2.5 Vendor-Affirmed Operational Environments – Software, Firmware, Hybrid

The vendor does not affirm any operational environments.

N/A for this module.

## 2.3 Excluded Components

The bulleted list below specifies the hardware components of the cryptographic module that are excluded from the security requirements, as well as the rationale for exclusion.

- Excluded Hardware Components
  - NVDEC: NVDEC is an independent uncoded block which is used for video decode acceleration. It has cryptographic functionality to handle DRM content. However, all cryptographic blocks are dedicated and located within this block. It does not provide any functionality or support to the GSP/SEC2 components and has an independent path for access to resources in the chip. The cryptographic functionality is not used in the module's services or to fulfill any of the module's security objectives.
  - Minion: This is an independent uncoded block to manage the NVLINK PHY programming. It has cryptographic functionality to authenticate and decrypt the firmware that is running on it. However, it provides no service or support to the GSP/SEC2 components and has an independent path to access

chip resources for its own functioning. The cryptographic functionality is not used in the module's services or to fulfill any of the module's security objectives.

- PMU: This is an independent uncoded block to manage the chip power management functions. It has cryptographic functionality to authenticate and decrypt the firmware that is running on it. However, it provides no service or support to GSP/SEC2 components and has an independent path to access chip resources for its own functioning. The cryptographic functionality is not used in the module's services or to fulfill any of the module's security objectives.
- FSP: FSP is an independent uncoded block that does not provide services to GSP/SEC2 and has dedicated crypto blocks located within the block. The cryptographic functionality is not used in the module's services or to fulfill any of the module's security objectives.
- Front Capacitors: The module includes package-level capacitors located along the package edges, used solely for decoupling and signal conditioning between internal die power/IO nets and the package pins. These components do not store or process SSPs, user data, or security-relevant control/status information.

These hardware components cannot be used to cause a compromise. Further, the module's physical security is maintained in the absence of these components. Thus, these hardware components have been excluded from the module validation.

## 2.4 Modes of Operation

### 2.4.1 Modes List and Description

The table below lists the mode of operation supported by the module.

| Mode Name | Description                                         | Type     | Status Indicator               |
|-----------|-----------------------------------------------------|----------|--------------------------------|
| Approved  | The only supported mode of operation of the module. | Approved | FIPS Mode ON; Devtools Mode ON |

**Table 3: Modes List and Description**

## 2.5 Algorithms

### 2.5.1 Approved Algorithms

The module employs cryptographic algorithm implementations from the following sources:

- Copy Engine (Cert. [A2733](#))
- GPU Service Processor (Cert. [A2732](#), [A4422](#))
- Security Controller (Cert. [A2730](#), [A4423](#))
- Root of Trust Storage for Storage (Cert. [A4414](#))

The module implements the Approved algorithms listed in the table below.

## Copy Engine

| Algorithm | CAVP Cert | Properties                                                                                                 | Reference  |
|-----------|-----------|------------------------------------------------------------------------------------------------------------|------------|
| AES-ECB   | A2733     | Direction - Encrypt<br>Key Length - 256                                                                    | SP 800-38A |
| AES-GCM   | A2733     | Direction - Decrypt, Encrypt<br>IV Generation - External<br>IV Generation Mode - 8.2.1<br>Key Length - 256 | SP 800-38D |

**Table 4: Approved Algorithms - Copy Engine**

## GPU Service Processor

| Algorithm                | CAVP Cert | Properties                                                                                                 | Reference         |
|--------------------------|-----------|------------------------------------------------------------------------------------------------------------|-------------------|
| AES-ECB                  | A4422     | Direction - Decrypt, Encrypt<br>Key Length - 256                                                           | SP 800-38A        |

**Table 7: Approved Algorithms - Root of Trust for Storage**

Only the algorithms specified in the tables above are approved algorithms supported by the module in approved mode of operation

## 2.5.2 Vendor Affirmed Algorithms

The vendor affirms the following cryptographic security methods:

| Name                               | Properties          | Implementation | Reference                             |
|------------------------------------|---------------------|----------------|---------------------------------------|
| CKG Section 6.1 Symmetric          | Key type:Symmetric  | N/A            | SP 800-133 Rev. 2 Section 6.1         |
| CKG Section 4 Example 1 Asymmetric | Key type:Asymmetric | N/A            | SP 800-133 Rev. 2 Section 4 Example 1 |
| CKG Section 4 Example 2 Asymmetric | Key Type:Asymmetric | N/A            | SP 800-133 Rev. 2 Section 4 Example 2 |

**Table 8: Vendor-Affirmed Algorithms**

## 2.5.3 Non-Approved, Allowed Algorithms

The module does not offer any non-approved, allowed algorithms.

N/A for this module.

## 2.5.4 Non-Approved, Allowed Algorithms with No Security Claimed

The table below lists the non-approved, allowed algorithms with no security claimed.

| Name                                    | Caveat                                                                                                                                                                                                                          | Use and Function                                                                         |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
| AES ECB (No Security Claimed)           | No Security Claimed; AES-ECB is only used as a pre-requisite for the AES-GCM which is only used within an encrypted tunnel. (IG 2.4.A Scenario 2c)                                                                              | Pre-requisite AES mode for the AES GCM implemented operating within an encrypted tunnel. |
| AES-GCM (No Security Claimed)           | No Security Claimed; AES-GCM is used within an encrypted tunnel. (IG 2.4.A Scenario 2c)                                                                                                                                         | AES-GCM for data transfer within an encrypted AES-GCM tunnel.                            |
| ECDSA KeyGen (No Security Claimed)      | No Security Claimed; ECDSA KeyGen is used for key generation of key pairs used for the attestation report. (IG 2.4.A Scenario 2)                                                                                                | Generation of the ECDSA Key Pairs for the Attestation Report Service                     |
| ECDSA SigGen (No Security Claimed)      | No Security Claimed; ECDSA SigGen is used for signature generation used for the attestation report. (IG 2.4.A Scenario 2)                                                                                                       | Generation of the ECDSA signatures for the Attestation Report Service                    |
| HMAC-SHA2-256 (No Security Claimed)     | No Security Claimed; SHA2-256 is only used as a pre-requisite for the KBKDF which is used as a conditioning component for the GSP_UDS_KDK and GSP_UDS1, and key derivation of AK_Seed_NonCA and GSP_UDS1. (IG 2.4.A Scenario 2) | Conditioning Component                                                                   |
| KBKDF (SP800-108) (No Security Claimed) | No Security Claimed; KBKDF is used as a conditioning component for the GSP_UDS_KDK and GSP_UDS1, and key derivation of AK_Seed_NonCA and GSP_UDS1. (IG 2.4.A Scenario 2)                                                        | Conditioning Component                                                                   |
| SHA2-256 (No Security Claimed)          | No Security Claimed; SHA2-256 is only used as a pre-requisite for the KBKDF which is used as a conditioning component for the GSP_UDS_KDK and GSP_UDS1, and key derivation of AK_Seed_NonCA and GSP_UDS1. (IG 2.4.A Scenario 2) | Conditioning Component                                                                   |

| Name                           | Caveat                                                                                                                                                                           | Use and Function                                                                                            |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|
| SHA2-384 (No Security Claimed) | No Security Claimed; SHA2-384 is only used as a pre-requisite for the ECDSA SigGen which is used for signature generation used for the attestation report. (IG 2.4.A Scenario 2) | Pre-requisite hash algorithm for the ECDSA SigGen which is used for signature generation                    |
| SPDM KDF (No Security Claimed) | No Security Claimed; The SPDM KDF is used within an encrypted tunnel. (IG 2.4.A Scenario 2c)                                                                                     | SPDM KDF for use in SPDM protocol. Note that the SPDM protocol operates within an encrypted AES-GCM tunnel. |

**Table 9: Non-Approved, Allowed Algorithms with No Security Claimed**

## 2.5.5 Non-Approved, Not Allowed Algorithms

The module does not offer any non-approved, not allowed algorithms.

N/A for this module.

## 2.6 Security Function Implementations

The table below lists the security function implementations for this module.

| Name                                     | Type    | Description                                                                              | Properties             | Algorithms                                                                                                             |
|------------------------------------------|---------|------------------------------------------------------------------------------------------|------------------------|------------------------------------------------------------------------------------------------------------------------|
| AES-GCM for DMA                          | BC-Auth | 256-bit AES-GCM used by the GPU -> CPU DMA Key and CPU -> GPU DMA Key for data transfer. | Publication:SP 800-38D | AES-ECB: (A4422)<br>Key Length: 256 bits<br>AES-GCM: (A4422)<br>Key Length: 256 bits                                   |
| AES-GCM for KMD                          | BC-Auth | 256-bit AES-GCM used by the GPU -> CPU KMD Key and CPU -> GPU KMD Key for data transfer. | Publication:SP 800-38D | AES-ECB: (A2733, A4423)<br>Key Length: 256 bits<br>AES-GCM: (A2733, A4423)<br>Key Length: 256 bits                     |
| AES-GCM for RPC                          | BC-Auth | 256-bit AES-GCM used by the GPU -> CPU RPC Key and CPU -> GPU RPC Key for data transfer. | Publication:SP 800-38D | AES-ECB: (A4422)<br>Key Length: 256 bits<br>AES-GCM: (A4422)<br>Key Length: 256 bits                                   |
| AES-GCM for Secure Session Establishment | BC-Auth | AES-GCM used for obfuscating the SPDM operations.                                        | Publication:SP 800-38D | AES-ECB: (A4422)<br>Key Length: 256 bits<br>AES-GCM: (A4422)<br>Key Length: 256 bits                                   |
| AES-GCM for SPDM                         | BC-Auth | AES-GCM used for obfuscating the SPDM operations.                                        |                        | AES ECB (No Security Claimed): ()<br>Key Length: 256 bits<br>AES-GCM (No Security Claimed): ()<br>Key Length: 256 bits |
| AES-GCM for UMD                          | BC-Auth | 256-bit AES-GCM used by the GPU -> CPU UMD Key and CPU -> GPU UMD Key for data transfer. | Publication:SP 800-38D | AES-ECB: (A2733, A4423)<br>Key Length: 256 bits<br>AES-GCM: (A2733, A4423)<br>Key Length: 256 bits                     |

| Name                                                | Type               | Description                                                                                                                                    | Properties                    | Algorithms                                                                                                                                                                   |

Table 10: Security Function Implementations

## 2.7 Algorithm Specific Information

The information below provides algorithm information of references to specifications.

### 2.7.1 AES GCM IV

All AES GCM IVs are 96 bits in size and constructed deterministically. This applies for each of the algorithm implementations:

- AES GCM IV Generation (GPU Service Processor)
- AES GCM IV Generation (Security Controller)
- AES GCM IV Generation (Copy Engine)

As per I.G. C.H Key/IV Pair Uniqueness Requirements from SP 800-38D, AES GCM IV implements scenario 4.

## 2.8 RBG and Entropy

The table below specifies the module's entropy certificates. Please note that SECHUB and SEC2 refer to the Security Processor.

| Cert Number | Vendor Name |
|-------------|-------------|
| E201        | NVIDIA      |

**Table 11: Entropy Certificates**

The table below specifies the module's entropy sources.

| Name                                   | Type     | Operational Environment | Sample Size | Entropy per Sample | Conditioning Component                               |
|----------------------------------------|----------|-------------------------|-------------|--------------------|------------------------------------------------------|
| Nvidia Random Number Generator (NVRNG) | Physical | H100(SECHUB)            | 128 bits    | 128 bits           | Conditioning Component AES-CBC-MAC SP800-90B (A4423) |

**Table 12: Entropy Sources**

The DRBG requests 384 bits from the entropy source, resulting in 256 bits of entropy strength.

## 2.9 Key Generation

The module uses the following methods for key generation:

- CKG
- ECDSA KeyGen

As per *IG D.H* and *SP 800-133rev2*, the module uses an Approved Counter DRBG to generate random values and seeds that are used for asymmetric and symmetric key generation. The generated seed is an unmodified output from the Counter DRBG.

## 2.10 Key Establishment

### 2.10.1 Key Agreement Information

The module supports the following key agreement methods:

- KAS-ECC-SSC Sp800-56Ar3 (Elliptic curve Diffie-Hellman) and KDA HKDF SP800-56Cr2: Per FIPS 140-3 Implementation Guidance D.F, this key agreement method claims Scenario 2 path (2).

### 2.10.2 Key Transport Information

The module does not support any key transport methods.

## 2.11 Industry Protocols

The module supports the following industry protocol:

- SPDM

The SPDM protocol is implemented within an AES-GCM encrypted tunnel. No parts of the SPDM protocol have been tested by the CAVP and CMVP.

## 3. Cryptographic Module Interfaces

### 3.1 Ports and Interfaces

The H100 Tensor Core GPU is a single-chip processor embedded in a general-purpose computer or server. It connects to the host device via a PCIe connector. The design of this connector supports information flows in four logically distinct and isolated categories:

- Data Input
- Data Output
- Control Input
- Status Output

A mapping of the FIPS-defined interfaces, the host device's physical interfaces, and the module's logical interfaces can be found in the table below.

| Physical Port | Logical Interface(s)                                        | Data That Passes                                                                                                                                                                                                                             |
|---------------|-------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| C2C pins      | Data Input<br>Data Output                                   | User Mode Application Data                                                                                                                                                                                                                   |
| GPIO pins     | Control Input                                               | GPIO are General Purpose Input/Output ports that allow the system to control H100. Things like Voltage Regulators, Fans, and LEDs are connected to GPIOs. No user data goes over the GPIOs.                                                  |
| I2C pins      | Control Input<br>Status Output                              | I2C is a low bandwidth control path H100. It allows the system BMC (Baseboard Management Controller) to perform system maintenance tasks like querying H100 temperature and other telemetry. No User Mode Application Data flows across I2C. |
| NVLINK pins   | Data Input<br>Data Output<br>Control Input                  | NVLINK allows for fast transfer of User Mode Application Data between multiple H100s.                                                                                                                                                        |
| PCIe pins     | Data Input<br>Data Output<br>Control Input<br>Status Output | PCIe endpoint is the primary control port for the H100. All host interactions go through the PCIe endpoint, including User Mode Application data, Kernel Mode Data, and Host configuration commands.                                         |
| Power pins    | Power                                                       | N/A                                                                                                                                                                                                                                          |
| SPI pins      | Control Input                                               | Used to read in firmware.                                                                                                                                                                                                                    |
| Straps pins   | Control Input                                               | Straps are board level settings that configure physical properties of the GPU. These are not dynamically modifiable.                                                                                                                         |

**Table 13: Ports and Interfaces**

The module also includes two ports that are disabled during normal module operation:

- JTAG – JTAG is the port that is used for silicon debug and manufacturing.
- TESTOUT – This port is used to read out device status during manufacturing.

## 4. Roles, Services, and Authentication

### 4.1 Authentication Methods

The module supports role-based authentication; operators explicitly assume an authorized role based on the authentication credentials used. Module operators authenticate to the module using a certificate. The strength calculations for each of the authentication mechanisms are provided in the table below.

| Method Name                      | Description                                                                                                                                            | Security Mechanism            | Strength Each Attempt | Strength per Minute |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------|-----------------------|---------------------|
| Certificate-based authentication | The mechanism provides mutual authentication between the requester (CPU which can assume the CO or User role) and responder (GPU which is the module). | RSA SigVer for Authentication | $1/2^{128}$           | $2/2^{128}$         |

**Table 14: Authentication Methods**

### 4.2 Roles

The module Crypto Officer (CO) that authorized operators can assume. The CO role performs cryptographic initialization or management functions and general security services.

The module also supports the following role(s):

- User – The User role performs general security services, including cryptographic operations and other approved security functions.

The table below lists additional information about the supported roles.

| Name           | Type | Operator Type | Authentication Methods           |
|----------------|------|---------------|----------------------------------|
| Crypto Officer | Role | CO            | Certificate-based authentication |
| User           | Role | User          | Certificate-based authentication |

**Table 15: Roles**

### 4.3 Approved Services

Descriptions of the services available are provided in the table below.

The keys and Sensitive Security Parameters (SSPs) listed in the table indicate the type of access required using the following notation:

- G = Generate: The module generates or derives the SSP.
- R = Read: The SSP is read from the module (e.g., the SSP is output).
- W = Write: The SSP is updated, imported, or written to the module.
- E = Execute: The module uses the SSP in performing a cryptographic operation.

- Z = Zeroize: The module zeroizes the SSP.

| Name               | Description                               | Indicator                             | Inputs                        | Outputs                                                                               | Security Functions                                                                                                                                                                                                             | SSP Access                                                                                                                                                                                                                                                                |

Table 16: Approved Services

## 4.4 Non-Approved Services

The module does not offer any non-Approved services.

N/A for this module.

## 4.5 External Software/Firmware Loaded

Module firmware is loaded from an external source at power on. The module does not allow the operator to load firmware from an external source for upgrading the module firmware version.

## 5. Software/Firmware Security

---

### 5.1 Integrity Techniques

All FIPS firmware components within the cryptographic boundary are verified using an approved integrity technique implemented within the cryptographic module itself. The module implements a 3072-bit RSA digital signature verification with SHA2-384 for the firmware integrity tests of GSP and SEC2. The RSA implementations used for the firmware integrity check on the GSP firmware have been awarded CAVP certificate A2732 and for the SEC2 firmware A2730. The SHA implementations used to support the RSA implementations have also been awarded CAVP certificates for the GSP and SEC2 firmware, respectively: A4422 and A4423. The module's executable code is in the form of two compiled firmware images loaded onto the module, one for GSP and one for SEC2. The file name of the binary is NV\_GPU\_VBIOS\_G520\_0202\_885. A firmware load test is to be considered inherently performed by the firmware integrity test after firmware is loaded into the module. Failure of the integrity check will cause the module to enter a critical error state.

### 5.2 Initiate on Demand

The CO can initiate the pre-operational tests on demand by rebooting/power-cycling the module.

## 6. Operational Environment

---

### 6.1 Operational Environment Type and Requirements

The H100 Tensor Core GPU comprises a firmware driver that executes in a Non-Modifiable operational environment.

### 6.2 Configuration Settings and Restrictions

The operating system offers no mechanism whereby the operator can modify firmware components, nor can the operator load and execute software or firmware that was not included as part of the validation of the module.

# 7. Physical Security

---

## 7.1 Mechanisms and Actions Required

The H100 is implemented as a single-chip embodiment with seven dies in a single package. It is manufactured using standard integrated circuit manufacturing technologies, producing a device that meets all commercial-grade power, temperature, reliability, shock, and vibration specifications, and all integrated circuits are coated with commercial standard passivation.

The H100 physical package provides hardness, opacity, and tamper-evidence protection conforming to FIPS 140-3 Physical Security Level 2. The H100 achieves this level of protection by implementing a chip enclosure (IC package) that is both hard and opaque (refer to Figure 2 above). This type of IC package ensures that any physical tampering will always result in scratches, chipping, or other visible damage on the enclosure.

The module implements the following physical security mechanisms in the table below.

| Mechanism              | Inspection Frequency | Inspection Guidance                              |
|------------------------|----------------------|--------------------------------------------------|
| Enclosure (IC package) | 6 months             | Verify chip package not compromised or tampered. |

Table 17: Mechanisms and Actions Required

## 8. Non-Invasive Security

---

This section is not applicable. There are currently no approved non-invasive mitigation techniques references in Annex F of *ISO/IEC 19790*.

## 9. Sensitive Security Parameters Management

### 9.1 Storage Areas

The table below lists sensitive security parameters (SSPs) storage areas for this module.

| Storage Area Name | Description                                                                      | Persistence Type |
|-------------------|----------------------------------------------------------------------------------|------------------|
| DRAM/HBM          | DRAM/RAM stores SPDH Key Wrapping Key, Export Master Key, and ECDHE SSPs.        | Dynamic          |
| FIFO              | FIFO stores DRBG SSPs.                                                           | Dynamic          |
| Fuses             | Fuses store GSP_UDS_KDK, IK_Pvt, and Firmware Integrity Key.                     | Static           |
| Keyslot           | Keyslot contains keys used for secure communication between the GPU and the CPU. | Dynamic          |
| TCM               | TCM stores ephemeral SSPs and non-SSPs.                                          | Dynamic          |

**Table 18: Storage Areas**

### 9.2 SSP Input-Output Methods

The module does not have any SSP input or output methods.

| Name                     | From     | To       | Format Type | Distribution Type | Entry Type | SFI or Algorithm |
|--------------------------|----------|----------|-------------|-------------------|------------|------------------|
| Key Establishment export | DRAM/HBM | External | Plaintext   | Automated         | Electronic |                  |
| Key Establishment import | External | DRAM/HBM | Plaintext   | Automated         | Electronic |                  |
| Public key export        | TCM      | External | Plaintext   | Automated         | Electronic |                  |
| Public key import        | External | TCM      | Plaintext   | Automated         | Electronic |                  |

**Table 19: SSP Input-Output Methods**

### 9.3 SSP Zeroization Methods

The table below lists SSP zeroization methods for this module.

| Zeroization Method           | Description                                               | Rationale                                                                                              | Operator Initiation                                                                                                                                                 |
|------------------------------|-----------------------------------------------------------|--------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Reset                        | Upon SECHUB or GSP reset commands, the SSPs are zeroized. | Resetting the SECHUB and GSP overwrites the SSPs with zeroes, yielding them irretrievable.             | Operator resets SECHUB and GSP using the following zeroization commands:<br><code>/sys/bus/pci/drivers/nvidia/unbind sudo rmmod nvidia_uvm sudo rmmod nvidia</code> |
| Session Termination          | Upon session termination, the memory will be cleared.     | Session termination overwrites the SSPs with zeroes, yielding them irretrievable.                      | Operator terminates session.                                                                                                                                        |
| Zeroization after use (FIFO) | After use, SSPs stored in FIFO will be zeroized.          | When done using the SSP, the SSP stored in FIFO is overwritten with zeroes, yielding it irretrievable. | Operator calls service and the SSPs used by this service are zeroized after use.                                                                                    |

| Zeroization Method          | Description                                         | Rationale                                                                                                 | Operator Initiation                                                              |
|-----------------------------|-----------------------------------------------------|-----------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
| Zeroization after use (TCM) | After use, SSPs stored in the TCM will be zeroized. | When done using the SSP, the SSP stored in the TCM is overwritten with zeroes, yielding it irretrievable. | Operator calls service and the SSPs used by this service are zeroized after use. |

**Table 20: SSP Zeroization Methods**

## 9.4 SSPs

The module supports the keys and other SSPs listed in the table below. Please note the SSPs tables include entries that are not considered SSPs but are otherwise included for completeness everywhere they are referenced.

| Name               | Description                                                                                       | Size - Strength     | Type - Category             | Generated By                      | Established By                                            | Used By                                                                                                                                  |
|--------------------|---------------------------------------------------------------------------------------------------|---------------------|-----------------------------|-----------------------------------|-----------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| AES GCM IV         | Used as the initialization vector for symmetric keys that use AES-GCM.                            | 96 bits - 96 bits   | Initialization Vector - PSP | Other (IG C.H Scenario 4)         |                                                           | AES-GCM for DMA<br>AES-GCM for SPDM<br>AES-GCM for KMD<br>AES-GCM for RPC<br>AES-GCM for Secure Session Establishment<br>AES-GCM for UMD |
| AK_Pub_NonCA       | Used for the attestation report.                                                                  | 384 bits - N/A      | Public - Neither            | ECDSA KeyGen for AK_Pvt/Pub_NonCA |                                                           | ECDSA SigGen for the device attestation certificate                                                                                      |
| AK_Pvt_NonCA       | Used for the attestation report.                                                                  | 384 bits - N/A      | Private - Neither           | ECDSA KeyGen for AK_Pvt/Pub_NonCA |                                                           | ECDSA SigGen for the device attestation certificate                                                                                      |
| AK_Seed_NonCA      | Used as the DRBG seed when generating the AK_Pvt_NonCA and AK_Pub_NonCA                           | 384 bits - N/A      | Seed - Neither              |                                   | KBKDF for AK_Seed_NonCA<br>SHA for Conditioning Component | ECDSA KeyGen for AK_Pvt/Pub_NonCA                                                                                                        |
| CPU -> GPU DMA Key | Used for secure communication between the CPU and GPU. DMAs initiated at both end points CPU-GPU. | 256 bits - 256 bits | Symmetric Key - CSP         |                                   | HKDF for Secure Session Establishment                     | AES-GCM for DMA                                                                                                                          |
| CPU -> GPU KMD Key | Used for secure communication between the CPU and GPU.                                            | 256 bits - 256 bits | Symmetric Key - CSP         |                                   | HKDF for Secure Session Establishment                     | AES-GCM for KMD                                                                                                                          |
| CPU -> GPU RPC Key | Used for secure communication between the CPU and GPU.                                            | 256 bits - 256 bits | Symmetric Key - CSP         |                                   | HKDF for Secure Session Establishment                     | AES-GCM for RPC                                                                                                                          |

| Name                             | Description                                                                                       | Size - Strength      | Type - Category      | Generated By                | Established By                        | Used By                                  |
|----------------------------------|---------------------------------------------------------------------------------------------------|----------------------|----------------------|-----------------------------|---------------------------------------|------------------------------------------|
| CPU -> GPU UMD Key               | Used for secure communication between the CPU and GPU.                                            | 256 bits - 256 bits  | Symmetric Key - CSP  |                             | HKDF for Secure Session Establishment | AES-GCM for UMD                          |
| Data Transfer Key                | Data transfer. Secure work launch HMAC key.                                                       | 256 bits - 256 bits  | Authentication - CSP |                             | HKDF for Secure Session Establishment | HMAC for Data Transfer                   |
| DRBG 'Key' Value                 | DRBG state value                                                                                  | 256 bits - 256 bits  | State value - CSP    | CKG (GPU Service Processor) |                                       | CKG (GPU Service Processor)              |
| DRBG 'V' Value                   | DRBG state value                                                                                  | 128 bits - 128 bits  | State value - CSP    | CKG (GPU Service Processor) |                                       | CKG (GPU Service Processor)              |
| DRBG Entropy Input               | DRBG entropy input                                                                                | 384 bits - 384 bits  | Entropy Input - CSP  | Entropy Source              |                                       | CKG (GPU Service Processor)              |
| DRBG Seed                        | DRBG seed value                                                                                   | 384 bits - 256 bits  | Seed - CSP           | CKG (GPU Service Processor) |                                       | CKG (GPU Service Processor)              |
| ECDHE Secret                     | Secure session establishment. Expanded with HKDF to derive SPDM ephemeral keys.                   | 384 bits - 192 bits  | Shared Secret - CSP  |                             | KAS-ECC-SSC                           | HKDF for Secure Session Establishment    |
| Ephemeral ECDH Private Component | Secure session establishment. Used for shared secret computation.                                 | 384 bits - 192 bits  | Private - CSP        | ECDSA KeyGen for ECDH       |                                       | KAS-ECC-SSC                              |
| Ephemeral ECDH Public Component  | Secure session establishment. Used for shared secret computation.                                 | 384 bits - 192 bits  | Public - PSP         | ECDSA KeyGen for ECDH       |                                       | KAS-ECC-SSC                              |
| Export Master Key                | Secure session establishment. For deriving additional keys.                                       | 256 bits - 256 bits  | Symmetric Key - CSP  |                             | HKDF for Secure Session Establishment | AES-GCM for Secure Session Establishment |
| Firmware Integrity Key           | Used in firmware integrity check                                                                  | 3072 bits - 128 bits | Public Key - PSP     | Pre-Loaded                  |                                       | RSA SigVer for Firmware Integrity        |
| GH100 Key                        | Used for certificate-based authentication.                                                        | 3072 bits - 128 bits | Public - PSP         |                             |                                       | RSA SigVer for Authentication            |
| GPU -> CPU DMA Key               | Used for secure communication between the CPU and GPU. DMAs initiated at both end points CPU-GPU. | 256 bits - 256 bits  | Symmetric Key - CSP  |                             | HKDF for Secure Session Establishment | AES-GCM for DMA                          |
| GPU -> CPU KMD Key               | Used for secure communication between the CPU and GPU.                                            | 256 bits - 256 bits  | Symmetric Key - CSP  |                             | HKDF for Secure Session Establishment | AES-GCM for KMD                          |

**Table 22: SSP Table 2**

# 10. Self-Tests

The module performs pre-operational self-tests and conditional self-tests. Pre-operational tests are performed between the time the cryptographic module is instantiated and before the module transitions to the operational state. Conditional self-tests are performed by the module during module operation when certain conditions exist. The following sections list the self-tests performed by the module, their expected error status, and the error resolutions.

## 10.1 Pre-Operational Self-Tests

The module performs the following pre-operational self-tests:

| Algorithm or Test              | Test Properties                | Test Method        | Test Type       | Indicator                                                                       | Details                                  |
|--------------------------------|--------------------------------|--------------------|-----------------|---------------------------------------------------------------------------------|------------------------------------------|
| RSA SigVer (FIPS186-5) (A2730) | 3072-bit with SHA2-384 (A4423) | Firmware Integrity | SW/FW Integrity | On success module will proceed into normal operation, on fail module will halt. | Firmware integrity test on SEC2 firmware |
| RSA SigVer (FIPS186-5) (A2732) | 3072-bit with SHA2-384 (A4422) | Firmware Integrity | SW/FW Integrity | On success module will proceed into normal operation, on fail module will halt. | Firmware integrity test on GSM firmware  |

**Table 23: Pre-Operational Self-Tests**

Please note that algorithms must pass their own CASTs before being used for the pre-operational firmware integrity tests.

## 10.2 Conditional Self-Tests

The module performs the following conditional self-tests:

| Algorithm or Test       | Test Properties | Test Method     | Test Type | Indicator                                                                       | Details | Conditions |
|-------------------------|-----------------|-----------------|-----------|---------------------------------------------------------------------------------|---------|------------|
| AES-GCM Decrypt (A2733) | 256-bit         | Comparison Test | CAST      | On success module will proceed into normal operation, on fail module will halt. | Decrypt | Boot up    |
| AES-GCM Decrypt (A4422) | 256-bit         | KAT             | CAST      | On success module will proceed into normal operation, on fail module will halt. | Decrypt | Boot up    |
| AES-GCM Decrypt (A4423) | 256-bit         | KAT             | CAST      | On success module will proceed into normal operation, on fail module will halt. | Decrypt | Boot up    |

| Algorithm or Test                                 | Test Properties                          | Test Method                 | Test Type | Indicator                                                                       | Details                                                             | Conditions |

**Table 24: Conditional Self-Tests**

## 10.3 Periodic Self-Test Information

The module does not perform periodic self-tests automatically, but the operator may conduct self-tests on demand via the methods listed in Section 10.5 below. The tables below provide information regarding the pre-operational self-tests and conditional self-tests, respectively, that the operator can perform on demand:

| Algorithm or Test              | Test Method        | Test Type       | Period    | Periodic Method |
|--------------------------------|--------------------|-----------------|-----------|-----------------|
| RSA SigVer (FIPS186-5) (A2730) | Firmware Integrity | SW/FW Integrity | On Demand | Manually        |
| RSA SigVer (FIPS186-5) (A2732) | Firmware Integrity | SW/FW Integrity | On Demand | Manually        |

**Table 25: Pre-Operational Periodic Information**

| Algorithm or Test                                 | Test Method                 | Test Type | Period                   | Periodic Method |
|---------------------------------------------------|-----------------------------|-----------|--------------------------|-----------------|
| AES-GCM Decrypt (A2733)                           | Comparison Test             | CAST      | On Demand and Continuous | Manually        |
| AES-GCM Decrypt (A4422)                           | KAT                         | CAST      | On Demand                | Manually        |
| AES-GCM Decrypt (A4423)                           | KAT                         | CAST      | On Demand                | Manually        |
| AES-GCM Encrypt (A2733)                           | Comparison Test             | CAST      | On Demand and Continuous | Manually        |
| AES-GCM Encrypt (A4422)                           | KAT                         | CAST      | On Demand                | Manually        |
| AES-GCM Encrypt (A4423)                           | KAT                         | CAST      | On Demand                | Manually        |
| Continuous health Test - Adaptive Proportion Test | Fault Detection             | CAST      | On Demand                | Manually        |
| Continuous health Test - Repetitive Count Test    | Fault Detection             | CAST      | On Demand                | Manually        |
| Counter DRBG (A4422)                              | KAT                         | CAST      | On Demand                | Manually        |
| DRBG Health Tests                                 | Generate/Instantiate/Reseed | CAST      | On Demand                | Manually        |
| ECDSA KeyGen (FIPS186-5) (A2732)                  | PCT                         | PCT       | On Demand                | Manually        |
| ECDSA KeyGen (FIPS186-5) (A4422)                  | PCT                         | PCT       | On Demand                | Manually        |
| ECDSA SigGen (FIPS186-5) (A2732)                  | KAT                         | CAST      | On Demand                | Manually        |
| KAS-ECC-SSC Sp800-56Ar3 (A4422)                   | KAT                         | CAST      | On Demand                | Manually        |
| KDA HKDF SP800-56Cr2 (A4422)                      | KAT                         | CAST      | On Demand                | Manually        |

| Algorithm or Test                               | Test Method     | Test Type | Period                   | Periodic Method |
|-------------------------------------------------|-----------------|-----------|--------------------------|-----------------|
| RSA SigVer (FIPS186-5) (A2730)                  | KAT             | CAST      | On Demand                | Manually        |
| RSA SigVer (FIPS186-5) (A2732)                  | KAT             | CAST      | On Demand                | Manually        |
| SHA2-384 (A4414)                                | Comparison Test | CAST      | On Demand and Continuous | Manually        |
| SHA2-384 (A4422)                                | KAT             | CAST      | On Demand                | Manually        |
| SHA2-384 (A4423)                                | KAT             | CAST      | On Demand                | Manually        |
| Start-up health Test - Adaptive Proportion Test | Fault Detection | CAST      | On Demand                | Manually        |
| Start-up health Test - Repetitive Count test    | Fault Detection | CAST      | On Demand                | Manually        |

**Table 26: Conditional Periodic Information**

## 10.4 Error States

The table below describes the error states of the module.

| Name           | Description                                                                                          | Conditions                                                                           | Recovery Method                                                                                                                                                                    | Indicator                                                                              |
|----------------|------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| Critical Error | The module will no longer perform cryptographic services or output data over data output interfaces. | The module fails any self-test.<br>The operator fails to authenticate to the module. | The module must be re-initialized by reboot/power-cycle of the host platform. If the module continues to experience self-test failures, contact Nvidia Corporation for assistance. | Bits set in a status register. Error logs are viewable after power cycling the module. |

**Table 27: Error States**

## 10.5 Operator Initiation of Self-Tests

The operator may initiate self-tests on demand by rebooting or power-cycling the module.

# 11. Life-Cycle Assurance

---

The sections below describe how to ensure the module is operating in its validated configuration, including the following:

- Procedures for secure installation, initialization, startup, and operation of the module
- Maintenance requirements
- Administrator and non-Administrator guidance

The sections below describe how to ensure the module is operating in its validated configuration.

**Operating the module without following the guidance herein (including the use of undocumented services) will result in non-compliant behavior and is outside the scope of this Security Policy)**

## 11.1 Installation, Initialization, and Startup Procedures

### 11.1.1 Secure Installation

The module is delivered to the operator pre-installed on a compatible circuit board. The Crypto Officer shall inspect the module to ensure that the IC package has not been compromised or tampered with. If the module has been compromised or tampered, the Crypto Officer shall not install the module and should contact Nvidia Custom Support for assistance.

No further installation action is required by the operator.

### 11.1.2 Configuration

There are no specific configuration steps the operator needs to perform.

### 11.1.3 Initialization

This module is designed to support vendor applications, and these applications are the sole consumers of the cryptographic services provided by the module. No end-user action is required to initialize the module for operation; the calling application performs any actions required to initialize the module before the end user can use the module.

## 11.2 Administrator Guidance

There are no specific management activities required of the CO role to ensure that the module runs securely. However, if any irregular activity is noticed or the module is consistently reporting errors, then Nvidia Customer Support should be contacted.

The following list provides additional guidance for the CO:

- The CO can initiate the pre-operational self-tests (as well as the conditional and critical functions self-tests that are performed pre-operationally) on demand for periodic testing of the module by rebooting-power-cycling the host platform.
- To determine the module's operational status, the Crypto Officer can invoke the module's Show Status service.
- To zeroize the module's SSPs, the Crypto Officer can invoke the module's Zeroize service.
- To review the module's versioning information, the Crypto Officer can invoke the module's Show Versioning Information service.
- The module firmware supports a debug mode that is disabled by default. Enabling the debug mode results in a non-compliant state.

## 11.3 Non-Administrator Guidance

If any irregular activity is noticed or the module is consistently reporting errors, then Nvidia Customer Support should be contacted.

The following list provides additional policies for the User role:

- Maintenance, including protection and zeroization, of any keys and CSPs that exist outside the module's cryptographic boundary are the responsibility of the end-user. For the zeroization of keys in volatile memory, module operators can reboot/power-cycle the host device.
- In the event that power to the module is lost and subsequently restored, a new key for use with the AES-GCM encryption/decryption shall be established by the User by invoking the "Secure Session Establishment" and "Data Transfer" services.

## 11.4 End of Life

All ephemeral or temporary keys can be sanitized via power cycle. The operator must ensure the power-off state has been transitioned to at module end of life, which is a maximum of 10 years.

## 12. Mitigation of Other Attacks

---

The module does not claim to mitigate any attacks beyond the FIPS 140-3 Level 2 requirements for this validation. Therefore, per *ISO/IEC 19790:2012* section 7.12, requirements for this section are not applicable.

# Appendix A. Acronyms and Abbreviations

Table 28 provides definitions for the acronyms and abbreviations used in this document.

**Table 28: Acronyms and Abbreviations**

| Acronym | Definition                                                  |
|---------|-------------------------------------------------------------|
| AES     | Advanced Encryption Standard                                |
| AK      | Attestation Key                                             |
| API     | Application Programming Interface                           |
| BROM    | Boot Read-only Memory                                       |
| C2C     | Client to Client                                            |
| CBC     | Cipher Block Chaining                                       |
| CCCS    | Canadian Centre for Cyber Security                          |
| CMVP    | Cryptographic Module Validation Program                     |
| CO      | Cryptographic Officer                                       |
