Table 1: This Document History

# 1 – General

## 1.1 Overview

This document defines the Security Policy for HP Anyware Cryptographic Module, hereafter denoted the Module. The Module meets FIPS 140-3 overall Level 1 requirements, with security levels as described in section 1.2 below.

## 1.2 Security Levels

| Section | Title                                   | Security Level |
|---------|-----------------------------------------|----------------|
| 1       | General                                 | 1              |
| 2       | Cryptographic module specification      | 1              |
| 3       | Cryptographic module interfaces         | 1              |
| 4       | Roles, services, and authentication     | 1              |
| 5       | Software/Firmware security              | 1              |
| 6       | Operational environment                 | 1              |
| 7       | Physical security                       | N/A            |
| 8       | Non-invasive security                   | N/A            |
| 9       | Sensitive security parameter management | 1              |
| 10      | Self-tests                              | 1              |
| 11      | Life-cycle assurance                    | 1              |
| 12      | Mitigation of other attacks             | N/A            |
|         | Overall Level                           | 1              |

Table 2: Security Levels

## 1.3 Additional Information

In accordance with AS02.05, [ISO19790] §7.7 Physical Security is optional and does not apply to the Module.

| Term/Ref  | Description                                                                                                                          |

## 2 – Cryptographic Module Specification

### 2.1 Description

TOEPP: The platform(s) used for testing are documented in Table 6: Tested Operational Environments - Software, Firmware, Hybrid. If the onboard CPU of a tested platform supported a known PAA [FIPS 140-3 IG 2.3.C] and was desirable for FIPS use, then in accordance with [FIPS 140-3 IG2.3.C] that platform was tested both with and without PAA unless an identical or similar platform had already been tested. When an identical or similar platform was already tested, the new platform was tested only with PAA. This is reflected by the column PAA/PAI in table 6 as marked with a Yes or No entry. The Intel and AMD AESNI (AES New Instructions) are known PAA(s).

#### Purpose and Use:

The Module is a cryptography software library. The Module is a Multi-Chip Stand Alone embodiment. The Module is intended for use by U.S. and Canadian Federal agencies in addition to any other markets that require FIPS 140-3 validated cryptographic functionality. The Module was originally designed with embedded and IoT in mind. As a side effect of this design, it also scales exceptionally well on larger desktop and server systems allowing more connections per box than similar competing solutions.

The Module version under validation is Software Version v5.2.1.

**Module Type:** Software

**Module Embodiment:** Multi-Chip Standalone

**Module Characteristics:**

**Cryptographic Boundary:**

Figure 1 depicts the Module operational environment, with the software module cryptographic boundary highlighted in red inclusive of all Module entry points (API calls). The Module is defined as a *Software module* per AS02.03. No components are excluded from [140-3] requirements. The pre-operational approved integrity test is performed over all components of the cryptographic boundary. Updates to the Module are provided as a complete replacement in accordance with AS04.27 – AS04.35.

Table 4: Source Files

The source code files listed in Table “Source Files” result in the corresponding object files that comprise the HP Anyware Cryptographic Module boundary on each supported operating environment; the extensions of the object file can differ across environments.

## 2.2 Tested and Vendor Affirmed Module Version and Identification

### Tested Module Identification – Hardware:

N/A for this module.

### Tested Module Identification – Software, Firmware, Hybrid (Executable Code Sets):

| Package or File Name                         | Software/ Firmware Version | Features                              | Integrity Test |
|----------------------------------------------|----------------------------|---------------------------------------|----------------|
| wolfssl-5.6.3-commercial-fips-linuxv5.2.1.7z | v5.2.1                     | FIPS 140-3 module and SSL/TLS library | HMAC-SHA256    |

Table 5: Tested Module Identification – Software, Firmware, Hybrid (Executable Code Sets)

#### Tested Module Identification – Hybrid Disjoint Hardware:

N/A for this module.

#### Tested Operational Environments - Software, Firmware, Hybrid:

| Operating System                                | Hardware Platform            | Processors                | PAA/PAI | Hypervisor or Host OS | Version(s) |
|-------------------------------------------------|------------------------------|---------------------------|---------|-----------------------|------------|
| Anyware Trusted Zero Client Firmware Kernel 6.1 | Anyware Trusted Zero Client  | AMD Ryzen Embedded R1305G | No      |                       | v5.2.1     |
| Anyware Trusted Zero Client Firmware Kernel 6.1 | Anyware Trusted Zero Client  | AMD Ryzen Embedded R1305G | Yes     |                       | v5.2.1     |
| Anyware Trusted Zero Client Firmware Kernel 6.1 | HP tz655 Trusted Zero Client | AMD Ryzen Embedded R2314  | Yes     |                       | v5.2.1     |

Table 6: Tested Operational Environments - Software, Firmware, Hybrid

#### Vendor-Affirmed Operational Environments - Software, Firmware, Hybrid:

N/A for this module.

The Module conforms to [140-3 IG] 2.3.C *Processor Algorithm Accelerators (PAA) and Processor Algorithm Implementation (PAI)*. The Intel Processor AES-NI functions are identified by [140-3 IG] 2.3.C as a known PAA.

No vendor affirmed operational environments are claimed for this validation of the module.

### 2.3 Excluded Components

N/A the module does not support excluded components.

### 2.4 Modes of Operation

#### Modes List and Description:

| Mode Name                  | Description                                                                                                                                                              | Type     | Status Indicator       |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|------------------------|
| Approved mode of operation | The Module supports an Approved mode of operation. In this mode all services are available.                                                                              | Approved | FIPS_MODE_NORMAL (1)   |
| Degraded mode of operation | The Module implements a Degraded Mode of operation: when a CAST fails, that CAST is marked as failed and the module will inhibit use of algorithms governed by that CAST | Approved | FIPS_MODE_DEGRADED (2) |

Table 7: Modes List and Description

### Mode Change Instructions and Status:

Each time the module is power cycled or reloaded all CAST status are initialized to FIPS\_CAST\_STATE\_INIT.

Each algorithm invocation includes a check of the algorithms CAST status; if the CAST status is FIPS\_CAST\_STATE\_INIT the module will automatically run the CAST and that algorithms CAST status will be updated to either FIPS\_CAST\_STATE\_SUCCESS (if it passes) or FIPS\_CAST\_STATE\_FAILURE (if it fails). See degraded mode for when a CAST status fails.

To check the modules overall status at any time the cryptographic officer may use the Show Status service by calling wolfCrypt\_GetMode\_fips() this will return either:

FIPS\_MODE\_INIT (0) - Module is currently running its' pre-operational self-test in another thread (multi-threaded)

FIPS\_MODE\_NORMAL (1) - Module in normal mode of operation without errors

FIPS\_MODE\_DEGRADED (2) - Module in degraded mode of operation with some errors

FIPS\_MODE\_FAILED (3) - Module failed the integrity check and is not usable

To check the CAST state of any algorithm the cryptographic officer may use the Show Status Service by calling wc\_GetCastStatus\_fips(<algorithm type>) where algorithm type can be any of the following:

- FIPS\_CAST\_AES\_CBC
- FIPS\_CAST\_AES\_GCM
- FIPS\_CAST\_HMAC\_SHA1
- FIPS\_CAST\_HMAC\_SHA2\_256
- FIPS\_CAST\_HMAC\_SHA2\_512
- FIPS\_CAST\_HMAC\_SHA3\_256
- FIPS\_CAST\_DRBG
- FIPS\_CAST\_RSA\_SIGN\_PKCS1v15
- FIPS\_CAST\_ECC\_CDH
- FIPS\_CAST\_ECC\_PRIMITIVE\_Z
- FIPS\_CAST\_DH\_PRIMITIVE\_Z
- FIPS\_CAST\_ECDSA
- FIPS\_CAST\_KDF\_TLS12
- FIPS\_CAST\_KDF\_TLS13
- FIPS\_CAST\_KDF\_SSH

The returned status indicator of `wc_GetCastStatus_fips(<algorithm type>)` may be checked against any of the following states:

- FIPS\_CAST\_STATE\_INIT (0) - CAST hasn't run yet
- FIPS\_CAST\_STATE\_PROCESSING (1) - CAST is running
- FIPS\_CAST\_STATE\_SUCCESS (2) - CAST has passed previously
- FIPS\_CAST\_STATE\_FAILURE (3) - CAST has failed

### Degraded Mode Description:

The Module implements a degraded mode of operation: when a CAST fails, the module enters an error state. The algorithm CAST status is set to FIPS\_CAST\_STATE\_FAILED and the module runs all CASTS prior to the first operational use of any algorithm, regardless of the CAST having passed previously. Before exiting the error state, the module status (reported in the Show Status service) is set to FIPS\_MODE\_DEGRADED. Upon exiting the error state, the module enters the degraded mode of operation. This sequence of events is in accordance with AS02.26. The algorithm that failed its' CAST initially triggering the error state will no longer be available for use in degraded mode of operation and any algorithms that depend on that algorithm will also be unavailable for use. See Table 16: Conditional Self-Tests in section 10.2, column Conditions to see if a CAST failure will affect use of another algorithm. To recover from degraded mode of operation CO *shall* power cycle or reload the module (equivalent to a power cycle).

## 2.5 Algorithms

### Approved Algorithms:

| Algorithm | CAVP Cert | Properties                                                                                                                            | Reference  |

Table 8: Approved Algorithms

NOTE: Only the algorithms specified in this section are supported by the module in approved mode of operation.

No operational use of an algorithm may be performed until the corresponding CAST has passed.

#### Vendor-Affirmed Algorithms:

| Name  | Properties                         | Implementation                                                                                                                                                            | Reference                                                    |
|-------|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------|

| CKG-2 | Asymmetric:ECC<br>Asymmetric:FFC   | Linux 4.4 (Ubuntu 16.04 LTS) with an Intel Core i5-5300U CPU @2.30GHz x 4 with PAA; Linux 4.4 (Ubuntu 16.04 LTS) with an Intel Core i5-5300U CPU @2.30GHz x 4 without PAA | SP800-133r2 5.2<br>"Key Pairs for Key Establishment"         |
| CKG-3 | Symmetric:AES<br>Symmetric:HMAC    | Linux 4.4 (Ubuntu 16.04 LTS) with an Intel Core i5-5300U CPU @2.30GHz x 4 with PAA; Linux 4.4 (Ubuntu 16.04 LTS) with an Intel Core i5-5300U CPU @2.30GHz x 4 without PAA | SP800-133r2 6.2<br>"Derivation of Symmetric Keys"            |

Table 9: Vendor-Affirmed Algorithms

#### Non-Approved, Allowed Algorithms:

N/A for this module.

The Module does not implement non-approved algorithms. The services listed in this Security Policy include all cryptographic and non-cryptographic functionality.

NOTE: For TLS 1.2 KDF Extended master-secret *shall* be used in approved mode of operation.

#### Non-Approved, Allowed Algorithms with No Security Claimed:

N/A for this module.

#### Non-Approved, Not Allowed Algorithms:

N/A for this module.

## 2.6 Security Function Implementations

| Name                   | Type | Description                              | Properties | Algorithms                                                  |

Table 10: Security Function Implementations

## 2.7 Algorithm Specific Information

The conditions for using the Module in the Approved mode of operation are:

1. The Module is a cryptographic library and it is intended to be used with a calling application. The calling application is responsible for the usage of the primitives in the correct sequence including the IVs and sessions.
2. The keys used by the Module for cryptographic purposes are determined by the calling application. The calling application is required to provide keys in accordance with [140Drev2].
3. With the Module installed and configured in accordance with [UG] instructions, only the algorithms listed in the table in Section 2.5 are available. The module is in the Approved mode if the following conditions for algorithm use are met. NOTE: All conditions and restrictions below are met when the executable binary is built in accordance with the UG instructions. Applications that would be at risk of violating any restriction in this section will fail to build and link successfully against the compliant module binary executable.
  - a. Adherence to [140-3 IG] C.H *Key/IV Pair Uniqueness Requirements from SP 800-38D*. The Module supports both internal IV generation (for use with the [56Arev3] compliant KAS API entry points) and external IV generation (for TLS KAS usage). For internal IV generation, the Module complies with C.H 2, users MUST specify an IV length of GCM\_NONCE\_MID\_SZ or greater for internal IV generation otherwise specifying any length less than 96-bits is rejected by the module. For internal IV generation, C.H requires the calling application to use the modules internal approved DRBG to generate the random IV For external IV generation, the Module complies with C.H 1 (a), tested per option (ii) under C.H **TLS protocol IV generation**. The module performs a check for nonce\_explicit rollover, returning an error if that condition is encountered.
  - b. ECDSA and RSA signature generation must be used with a SHA-2 or SHA-3 hash function.
  - c. RSA signature generation and encryption primitives must use RSA keys with k = 2048, 3072 or 4096 bits or greater.
  - d. The calling process shall adhere to all current [131Arev2] algorithm usage restrictions.
4. Manual key entry is not supported.
5. Data output is inhibited during self-tests, zeroization, and error states.
6. RSA Decrypt Primitive (RSADP) with k=2048-bit is the only CAVP testable aspect of [56Brev2]. The module implements the RSA primitive operations only, there are no claims of key transport. The module implements 'RSA Encrypt Primitive' (RSAEP) and RSADP. The vendor affirms conformance to [56Brev2] for RSAEP and RSADP with other key sizes since no CAVP test is available for key sizes other than 2048-bit.

## 2.8 RBG and Entropy

N/A for this module.

N/A for this module.

## 2.9 Key Generation

## 2.10 Key Establishment

## 2.11 Industry Protocols

The Module conforms to [140-3 IG] D.C References to the Support of Industry Protocols: while the module provides [56A] conformant schemes and API entry points oriented to TLS and SSH usage, the Module does not contain the full implementation of TLS or SSH. The following statements are required per IG D.C case #2:

*No parts of the TLS protocol other than the approved cryptographic algorithms and the KDFs, have been tested by the CAVP and CMVP.*

*No parts of the SSH protocol other than the approved cryptographic algorithms and the KDFs, have been tested by the CAVP and CMVP.*

## 2.12 Additional Information

The Module design corresponds to the Module security rules. Security rules enforced by the Module are described in the appropriate context of this document.

# 3 Cryptographic Module Interfaces

## 3.1 Ports and Interfaces

| Physical Port              | Logical Interface(s) | Data That Passes                                                                 |
|----------------------------|----------------------|----------------------------------------------------------------------------------|
| N/A: Internal (call stack) | Control Input        | API entry point: stack frame including non-sensitive parameters                  |
| N/A: Internal (call stack) | Control Output       | API call parameters passed by reference for structures allocated by wolfCrypt    |
| N/A: Internal (call stack) | Data Input           | API call parameters passed by reference or value for cryptographic service input |
| N/A: Internal (call stack) | Data Output          | API call parameters passed by reference for cryptographic service output         |
| N/A: Internal (call stack) | Status Output        | API return value: enumerated status resulting from call execution                |

Table 11: Ports and Interfaces

Table 7 defines the Module's [140-3] logical interfaces; the Module does not interact with physical ports.

## 4 Roles, Services, and Authentication

### 4.1 Authentication Methods

N/A for this module.

### 4.2 Roles

| Name | Type | Operator Type | Authentication Methods |
|------|------|---------------|------------------------|
| CO   | Role | CO            |                        |

Table 12: Roles

The Module supports the Cryptographic Officer (CO) operator role, and does not support multiple concurrent operators, a maintenance role or bypass capability. The cryptographic module does not provide an authentication or identification method of its own. The CO role is implicitly identified by the service requested.

### 4.3 Approved Services

| Name              | Description                            | Indicator                                                    | Inputs                                                                     | Outputs                                                      | Security Functions                                                                                                                         | SSP Access                                        |

|--------------|-----------------------------------------------------------------|---------------------------------------------------------|--------|-----------------------------------------|--------------------|----------------------------------------------------------------------|
|              | Restarting the general-purpose computer clears all CSPs in RAM. |                                                         |        |                                         |                    | Z<br>- Secret V:<br>Z<br>- SC_EDK:<br>Z<br>- Entropy Input String: Z |
| Show Version | Provide Module Version                                          | Successful completion of the service (status code >= 0) | None   | Plaintext containing the module version |                    | CO                                                                   |

Table 13: Approved Services

All services implemented by the Module are listed in Table 16. The calling application may use the Show status service (wolfCrypt\_GetStatus\_fips call) to determine the status of the Module. A return code of FIPS\_MODE\_NORMAL means the Module is in a state without errors; Please see Section 2.4 for more information. In addition, as per [140-3 IG] 2.4.C the module supports an implicit indicator via the successful completion of a service, module does not support non-approved services.

See the HP Inc FIPS 140-3 User Guide [UG] for additional information on the cryptographic services listed in this section.

Note that the caller provides the KAS\_Private and KAS\_Public keys for shared secret computation; the caller's exchange and assurance of PSPs with the remote participant is outside the scope of the Module.

For services Generate Key Pair, Key Agreement and Key Derivation consistent with [140-3 IG] 9.5.A, available only if the *private\_key\_read\_enable* property is set to TRUE

## 4.4 Non-Approved Services

N/A for this module.

# 5 Software/Firmware Security

## 5.1 Integrity Techniques

The Module uses HMAC-SHA2-256 with a 256-bit key (HMAC Cert. #A4308) as the approved integrity technique. Before the integrity technique is executed the module performs an HMAC-SHA2-256 KAT.

## 5.2 Initiate on Demand

The operator can initiate the integrity test on demand by reloading the Module or by calling the API `wolfCrypt_IntegrityTest_fips()` at any time after power on. (See Section 10.5 “Operator Initiation of Self-Tests” later in this document for details of proper use of this API in an application).

## 5.3 Open-Source Parameters

While the module is not “open source” since it is only shipped under a commercial license, open source practice of source code delivery with a commercial license is standard for the module. As such the module (while not required to do so) will abide by ISO/IEC 19790:2012 B.2.5. Please see details in the HP Inc FIPS 140-3 User Guide [UG] for the [OE] listed on the FIPS certificate. Details will include information about compiler, compiler configuration settings and methods to compile the source code into an executable form in a FIPS validated manner. See also section 11.1 Installation, Initialization, and Startup Procedures later in this document.

# 6 Operational Environment

## 6.1 Operational Environment Type and Requirements

**Type of Operational Environment:** Modifiable

## 6.2 Configuration Settings and Restrictions

Any setting that affects the module directly while compiling the executable binary *shall* not be used. If unsure contact HP Inc by going to “<https://www.hp.com/us-en/services/workforce-solutions/workforce-computing/digital-workspaces/anyware-trust-center.html>” and using the “Support” option to initiate a support inquiry. An HP Anyware support staff member will review the setting for impact on the FIPS validated sources and determine if the setting is allowed or disallowed for an approved mode of operation. NOTE: The User Guide [UG] will contain an exact list of allowed settings. CO should refer to the [UG] first before contacting HP Anyware support.

## 6.3 Additional Information

The operational environment for the Module is modifiable.

Table 6 lists the operational environments on which the Module was tested.

Specification of the security rules, settings or restrictions to the configuration of the operational environment are covered in the [UG]. The configure script provided with the package detects the environment and sets the required flags.

There are no specific restrictions to the configuration of the operational environment unless stated in the [UG].

## 7 Physical Security

### 7.1 Mechanisms and Actions Required

N/A for this module.

### 7.5 EFP/EFT Information

N/A for this module.

### 7.6 Hardness Testing Temperature Ranges

N/A for this module.

## 8 Non-Invasive Security

The Module does not implement non-invasive security mechanisms.

## 9 Sensitive Security Parameters Management

### 9.1 Storage Areas

| Storage Area Name | Description  | Persistence Type |
|-------------------|--------------|------------------|
| S1                | RAM (Memory) | Dynamic          |

Table 14: Storage Areas

### 9.2 SSP Input-Output Methods

| Name | From                                     | To  | Format Type | Distribution Type | Entry Type | SFI or Algorithm |
|------|------------------------------------------|-----|-------------|-------------------|------------|------------------|
| IE1  | EXT: Call stack (API) input parameters   | INT | Plaintext   | Automated         | Electronic |                  |
| IE2  | INT: Call stack (API) output parameters  | EXT | Plaintext   | Automated         | Electronic |                  |
| IE3  | EXT: Loaded from external entropy source | INT | Plaintext   | Automated         | Electronic |                  |

Table 15: SSP Input-Output Methods

### 9.3 SSP Zeroization Methods

| Zeroization Method | Description                                                                                                                        | Rationale                               | Operator Initiation |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------|---------------------|
| Z1                 | cleared immediately after use                                                                                                      | Module does not store SSPs persistently | Zeroise             |
| Z2                 | Per ISO/IEC 19790:2012 section 7.9.7, parameters used solely for self-test purposes in 7.10 need not meet zeroisation requirements | FIPS 140-3 IG 9.7.B                     |                     |

Table 16: SSP Zeroization Methods

The module supports an implicit Zeroisation indicator. The implicit indicator is a successful completion of the service call.

## 9.4 SSPs

| Name   | Description                                               | Size - Strength                                                                                        | Type - Category | Generated By | Established By | Used By                                              |

Table 18: SSP Table 2

\* Per SP800-131Ar2 Section 3, Table 2, key sizes (1024-bit for RSA and 192-bit for ECC) are available for legacy use verification requirements when inter-oping with legacy systems. These key sizes shall not be used for signing operations.

## 10 Self-Tests

### 10.1 Pre-Operational Self-Tests

| Algorithm or Test | Test Properties                                                                        | Test Method | Test Type       | Indicator                            | Details |
|-------------------|----------------------------------------------------------------------------------------|-------------|-----------------|--------------------------------------|---------|
| HMAC-SHA2-256     | hash type: SHA256, key length: 32-bytes. Please note this is the module integrity test | KAT         | SW/FW Integrity | FIPS_MODE_NORMAL or FIPS_MODE_FAILED | MAC     |

Table 19: Pre-Operational Self-Tests

Each time the Module is powered on or loaded (equivalent to a power on) the integrity of the module is tested per ISO/IEC 19790:2012 Section 7.10.2.2. The very first step of the pre-operational self-test (POST) is to force every Conditional Algorithm Self-Test to be in the FIPS\_CAST\_STATE\_INIT mode meaning the CAST for a given algorithm has not run since power on and the CAST must run and pass prior to operational use of the algorithm.

The integrity test uses HMAC-SHA2-256 to ensure the modules integrity therefore per AS 10.20 HMAC CAST is triggered prior to the integrity check. The HMAC CAST uses a known answer test per ISO/IEC 19790-2012 Section 7.10.3.2. The POST executes outside user control as the module is powering on or being loaded.

### 10.2 Conditional Self-Tests

| Algorithm or Test | Test Properties      | Test Method | Test Type | Indicator                                          | Details | Conditions                                                                                         |
|-------------------|----------------------|-------------|-----------|----------------------------------------------------|---------|----------------------------------------------------------------------------------------------------|
| AES-CBC           | key length: 32-bytes | KAT         | CAS T     | FIPS_CAST_STATE_SUCCESS or FIPS_CAST_STATE_FAILURE | Encrypt | Before first use of algorithm(s) AES-ECB, AES-CBC, AES-CTR, AES-OFB, AES-GCM, AES-GMAC, AES-CCM or |

| DRBG              | DRBG mode: SHA2-256            | KAT         | CAS T     | FIPS_CAST_STATE_SUCCESS or FIPS_CAST_STATE_FAILURE    | Health-Test with sub-elements: Instantiate, Generate, Reseed | Before first use of algorithm(s) DRBG or Immediately upon registering an external entropy source with the module |

Table 20: Conditional Self-Tests

Once the module is powered on and has passed the POST, calls to any cryptographic algorithm will trigger the CAST on first operational use of the algorithm. The POST and CASTS are available on demand after power on and can be executed by the cryptographic officer (CO) at any time. The CO may optionally invoke any CAST ahead of algorithm use at a more convenient time rather than letting it run automatically on first use. Regardless of the CAST running manually or automatically, once it has passed the CO may manually re-run any CAST at any time in a periodic fashion, a CAST will no longer run automatically after it has passed the first time.

### 10.3 Periodic Self-Test Information

| Algorithm or Test | Test Method | Test Type       | Period | Periodic Method       |
|-------------------|-------------|-----------------|--------|-----------------------|
| HMAC-SHA2-256     | KAT         | SW/FW Integrity | P2     | Automatic or Manually |

Table 21: Pre-Operational Periodic Information

| Algorithm or Test  | Test Method | Test Type | Period | Periodic Method       |
|--------------------|-------------|-----------|--------|-----------------------|
| AES-CBC            | KAT         | CAST      | P1     | Manually              |
| AES-CBC            | KAT         | CAST      | P1     | Manually              |

Table 22: Conditional Periodic Information

| Name | Description                                                                                                                                                                                                                                                                                                                                                                   |
|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| P1   | Periodic method 1: Automatically by the module when algorithm is first invoked. CO may opt to invoke prior to first algorithm use to avoid delay at time of first operational use of an algorithm or at a later time manually.                                                                                                                                                |
| P2   | Periodic method 2: Automatically by the module during power on. CO may opt to invoke manually thereafter.                                                                                                                                                                                                                                                                     |
| P3   | Periodic method 3: Automatically during key generation service                                                                                                                                                                                                                                                                                                                |
| P4   | Automatically by the module upon first operational use of the DRBG algorithm. When an external entropy source is registered with the module by application level entropy callback function it is considered the first operational use of the DRBG. Does a periodic reseed every 1 million invocations, during the reseed the DRBG health test will be automatically executed. |

|                    |                                                                                                                                                                                                                                    | PKCSv1.5<br>DRBG<br>ECC<br>Diffie-Hellman<br>FFC<br>Diffie-Hellman<br>ECDSA<br>TLSv1.2<br>KDF<br>TLSv1.3<br>KDF<br>KDF<br>SSH |                                              |                                           |
| FIPS_MODE_DEGRADED | One or more of the CASTS have failed anytime following a successful power on and integrity check. Upon entering this mode the module will automatically run all CASTS prior to the operational use of any cryptographic algorithm. | Any CAST Failure                                                                                                              | Power Cycle                                  | fipsModelId set to FIPS_MODE_DEGRADED (2) |
| RSA_KEY_PAIR_E     | RSA Pairwise Consistency Test Failure                                                                                                                                                                                              | RSA-PCT                                                                                                                       | Manual self-test service call or power cycle | RSA_KEY_PAIR_E (-262)                     |
| ECC_PCT_E          | ECC Pairwise Consistency Test Failure                                                                                                                                                                                              | ECC-PCT                                                                                                                       | Manual self-test service call or power cycle | ECC_PCT_E (-286)                          |
| MP_CMP_E           | DH Pairwise Consistency Test Failure                                                                                                                                                                                               | DH-PCT                                                                                                                        | Manual self-test                             | MP_CMP_E (-120)                           |

| Name | Description | Conditions | Recovery Method             | Indicator |
|------|-------------|------------|-----------------------------|-----------|
|      |             |            | service call or power cycle |           |

Table 24: Error States

## 10.5 Operator Initiation of Self-Tests

For calling applications the following is required:

1. Include the library configuration header wolfssl/options.h (or user\_settings.h via wolfssl/wolfcrypt/settings.h) first.
2. After including the library configuration header, include wolfssl/wolfcrypt/fips\_test.h then use the API specified below to execute a given self-test.

CO may initiate all CAST self-tests in one-shot. The API wc\_RunAllCast\_fips() is provided as a public API to applications using the module that have included the headers above in proper order.

CO may initiate CAST self-tests individually using the API wc\_RunCast\_fips(algorithm type) with any of the below “algorithm type” inputs:

- FIPS\_CAST\_AES\_CBC
- FIPS\_CAST\_AES\_GCM
- FIPS\_CAST\_HMAC\_SHA1
- FIPS\_CAST\_HMAC\_SHA2\_256
- FIPS\_CAST\_HMAC\_SHA2\_512
- FIPS\_CAST\_HMAC\_SHA3\_256
- FIPS\_CAST\_DRBG
- FIPS\_CAST\_RSA\_SIGN\_PKCS1v15
- FIPS\_CAST\_ECC\_CDH
- FIPS\_CAST\_ECC\_PRIMITIVE\_Z
- FIPS\_CAST\_DH\_PRIMITIVE\_Z
- FIPS\_CAST\_ECDSA
- FIPS\_CAST\_KDF\_TLS12
- FIPS\_CAST\_KDF\_TLS13
- FIPS\_CAST\_KDF\_SSH

CO may re-run the POST at any time after power on using the public API wolfCrypt\_IntegrityTest\_fips(). This function always returns a value of zero regardless if the integrity check passed or failed so the CO *shall* then check the status of the module using the API wolfCrypt\_GetStatus\_fips(). The return value of the GetStatus API shall then be checked against the status indicators below:

- FIPS\_MODE\_INIT status indicator value is 0. This indicator means then integrity test has not completed and is likely running in another thread (multi-threaded)

- FIPS\_MODE\_NORMAL status indicator value is 1. This indicator means the integrity test passed and the module is in a state without errors
- FIPS\_MODE\_FAILED status indicator value is 3. This indicator means the integrity test failed and the module is unusable. The CO shall power cycle or reload (equivalent to power cycle) to restore the module.

## 11 Life-Cycle Assurance

### 11.1 Installation, Initialization, and Startup Procedures

The CO *shall* use the provided HP Inc FIPS 140-3 User Guide hereafter referred to as [UG]. A common name for this document is also the Cryptographic Officer Guidance Manual [COGM]. [UG] and [COGM] are one and the same for this module and include all administrative guidance. The [UG] will have a section specific to each Operational Environment [OE] that appears on the modules FIPS certificate and/or in Table 6: Tested Operational Environments - Software, Firmware, Hybrid. The instructions provided in the [UG] *shall* be followed or the module will never have been properly initialized and built and therefore non-compliant. To create the compliant module, as per this Security Policy, the configuration steps *shall* be followed.

- [UG] will include library configuration settings that are: *required*, *allowed* and *not allowed*.
  - For any setting that is not specifically covered the CO *shall* contact HP Inc by visiting “<https://www.hp.com/us-en/services/workforce-solutions/workforce-computing/digital-workspaces/anyware-trust-center.html>” and use the Support option for clarification about that settings impact on compiling the compliant module.
- [UG] will include details about the toolchain, compiler, compiler configuration settings and methods to compile the source code into an executable form.
  - While the module is not “open source” since it is only shipped under a commercial license, open source practice of source code delivery with a commercial license is standard for the module. As such the module (while not required to) will abide by ISO/IEC 19790:2012 B.2.5 “If the module is open source, specify the compilers and control parameters required to compile the code into an executable format” even though the module is not claiming “open source”.

The following initialization instructions apply to all use-cases for the module generically by a consuming application. [OE] specific details will be covered in the [UG].

- When planning on using the module the CO shall first include the library settings headers so the application knows how the library was configured.
  - On Unix or Linux like systems where auto-tools were used to configure the library (./configure && make) the CO *shall* include wolfssl/options.h as the very first header.
  - When working with IDEs or Makefile setups the CO *shall* include wolfssl/wolfcrypt/settings.h as the very first header and ensure that the define WOLFSSL\_USER\_SETTINGS is set globally at the project level. No other

wolfSSL specific build options should be set globally, all configurations will be managed by a custom user\_settings.h header that is included anytime WOLFSSL\_USER\_SETTINGS is defined globally.

- Once the library configuration settings have been included only then shall the CO include other wolfSSL headers as needed, any other headers shall always come after the configuration settings header.
- Upon entry into main() of an application the vendor recommends that the CO first register a fips callback. The fips callback will trigger anytime the module is in an unusable state. A sample of such a callback is provided below.

```
static void myFipsCb(int ok, int err, const char* hash)
{
    printf("in my Fips callback, ok = %d, err = %d\n", ok, err);
    printf("message = %s\n", wc_GetErrorString(err));
    printf("hash = %s\n", hash);

    if (err == IN_CORE_FIPS_E) {
        printf("In core integrity hash check failure,"
              "copy above hash\n");
        printf("into verifyCore[] in fips_test.c and rebuild\n");
    }
}
```

Figure 2: Code Sample A

- If using a FIPS callback the CO *will* register the FIPS callback by passing the function pointer of the FIPS callback function to the following API like so:  
wolfCrypt\_SetCb\_fips(myFipsCb);
- Prior to operational use of the module the CO *shall* register an entropy callback to load entropy into the module from an external entropy source. A portable callback is available but must be registered by the application on startup since the entropy source is external to the module. To register the portable callback provided with the module the application will call "ret = wc\_SetSeed\_Cb(wc\_GenerateSeed);" where "ret" is an integer to capture the status return of the call and should be checked against the value 0 for success or < 0 for failure. A successful register of any entropy callback function is considered the first operational use of the module outside of pre-operational tests and the DBRG CAST will run during registration of the callback.
- When working with a private key the application *must* programmatically unlock access to private key material with the API: wolfCrypt\_SetPrivateKeyReadEnable\_fips(true/false, key-type).
  - To unlock key access pass true (1) as the first input. CO *shall* pass WC\_KEYTYPE\_ALL as the second input parameter.
  - Once done working with the private key CO *shall* lock access to private key materials before resuming operations by calling the same API with input false (0) as the first parameter and WC\_KEYTYPE\_ALL as the second input parameter.

## 11.2 Administrator Guidance

The CO *shall* use the provided HP Inc FIPS 140-3 User Guide [UG].

### 11.3 Non-Administrator Guidance

The Module supports the Cryptographic Officer (CO) operator role and does not support non-administrators or non-administrative roles.

### 11.7 Additional Information

Please defer to HP Inc FIPS 140-3 User Guide [UG].

## 12 Mitigation of Other Attacks

The module does not claim mitigation of other attacks.
