## Overview

This document is a FIPS 140-2 Security Policy for Fortinet Incorporated's FortiManager-1000D Centralized Device Management appliances. This policy describes how the FortiManager-1000D (hereafter referred to as the "Module") meet the FIPS 140-2 security requirements and how to operate the Module in a FIPS compliant manner. This policy was created as part of the FIPS 140-2 Level 2 validation of the Module.

This document contains the following sections:

- [Introduction](#)
- [Security Level Summary](#)
- [Module Description](#)
- [Mitigation of Other Attacks](#)
- [FIPS 140-2 Compliant Operation](#)
- [Self-Tests](#)

The Federal Information Processing Standards Publication 140-2 - *Security Requirements for Cryptographic Modules* (FIPS 140-2) details the United States Federal Government requirements for cryptographic modules. Detailed information about the FIPS 140-2 standard and validation program is available on the NIST (National Institute of Standards and Technology) website at <http://csrc.nist.gov/groups/STM/cmvp/index.html>.

## References

This policy deals specifically with operation and implementation of the Module in the technical terms of the FIPS 140-2 standard and the associated validation program. Other Fortinet product manuals, guides and technical notes can be found at the Fortinet technical documentation website at <http://docs.fortinet.com>.

Additional information on the entire Fortinet product line can be obtained from the following sources:

## Introduction

FortiManager Network Security Management Appliances were designed to provide security management for large enterprise organizations and service providers. They enable you to centrally manage any number of Fortinet devices, including FortiManager, FortiWiFi, and FortiCarrier™. FortiManager provides the high performance and scalability you need to efficiently apply policies and distribute content security/firmware updates, regardless of the size of your network. FortiManager is one of several versatile Fortinet Management Products that provide a diversity of deployment types, growth flexibility, advanced customization through APIs and simple licensing.

## Security Level Summary

The Module meets the overall requirements for a FIPS 140-2 Level 2 validation.

**Table 1: Summary of FIPS security requirements and compliance levels**

Security Requirement	Compliance Level
Cryptographic Module Specification	2
Cryptographic Module Ports and Interfaces	3
Roles, Services and Authentication	3
Finite State Model	2
Physical Security	2
Operational Environment	N/A
Cryptographic Key Management	2
EMI/EMC	2
Self-Tests	2
Design Assurance	3
Mitigation of Other Attacks	N/A

## Module Description

The Module is a multiple chip, standalone cryptographic module consisting of production grade components contained in a physically protected enclosure in accordance with FIPS 140-2 Level 2 requirements.

### FortiManager-1000D specifications:

- 8 network interfaces (6 x 10/100/1000 RJ45, 2 x SFP ports)
- Intel Xeon E3-1225v2 Ivy Bridge 4C 3.2G 8M
- 16GB (4GB x 4) RAM
- 2U rackmount device
- 8TB (2TB x 4) hard disk drives
- 2 removable power supplies
- The validated firmware version is FortiManager 5.2.4, build0738, 150923 (GA).

## Cryptographic Boundary

Figure 1: FortiManager Physical Cryptographic Boundary

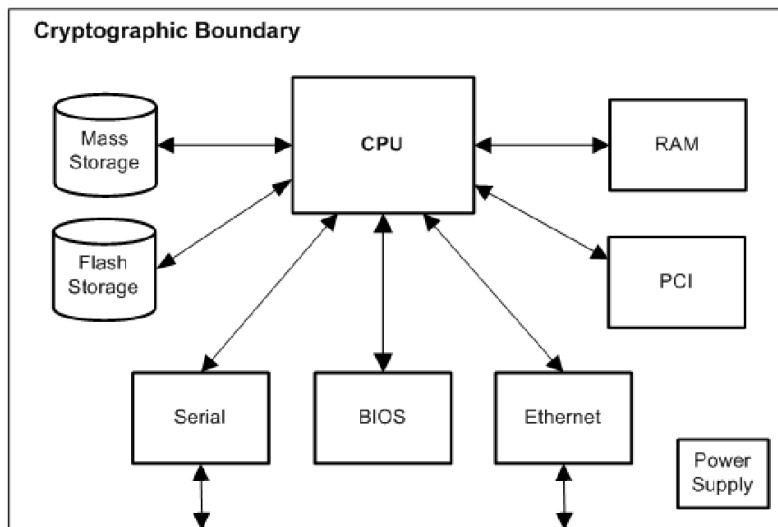

Figure 2: FortiManager Logical Cryptographic Boundary

The cryptographic boundary of the Module is defined as the Module's external, physical casing and includes all of the hardware, firmware, ports and interfaces required to operate the Module in a secure, FIPS 140-2 compliant manner.

## Cryptographic Module Ports and Interfaces

### FortiManager-1000D Module

Figure 3: FortiManager-1000D Front and Rear Panel Connectors and Ports

Table 2: FortiManager-1000D Front and Rear Panel Connectors and Ports

#	Interface	Type	Supported Logical Interfaces	Description
1	Console Port	RJ-45	Control input, status output	Optional RS-232 serial connection to the management computer. Provides access to the CLI.
2	USB	USB-A	Control input, key loading, archiving, entropy input	Two USB ports.
3	Power Supplies		Power	100-240V AC, 5-3A, 50-60Hz, redundant power supplies.
4	Ethernet Ports 1-6	RJ-45	Data input, data output, control input and status output	Gigabit Ethernet ports for connection to your network and the Internet.
5	SFP Ports 7-8	SFP	Data input, data output, control input and status output	1Gbps/auto small form-factor pluggable transceiver ports.

Figure 4: FortiManager-1000D Status LEDs

Table 3: FortiManager-1000D Status LEDs

#	LED	State	Description
1	HDD	Off	This LED is not used.
2	STA	Off	The unit is operating normally.
		Red	The unit has a major alarm.
3	PWR	Green	The system is on.
		Off	The system is off.
4	Power Supplies	Green	The power supply is running.
		Flashing Green	The power supply is functional but not running.
		Red	The power supply has failed.
		Flashing Red	Only this power supply is not powered.
		Flashing Red and Green	Power supply warning.
		Off	The power supply is not powered.
5	Ethernet Ports Activity	Amber	Port is active.
		Flashing Amber	Port is transmitting and receiving data.
		Off	Port is not connected.
5	Ethernet Ports Speed	Green	Port is connected at 1Gbps.
		Amber	Port is connected at 100Mbps.
		Off	Port is connected at 10Mbps or not in use.
6	SFP Ports Activity	Yellow	Port is active.
		Flashing Yellow	Port is transmitting and receiving data.
		Off	Port is not connected.
6	SFP Ports Link	Orange	Port is connected at 1Gbps.
		Off	Port is not connected.

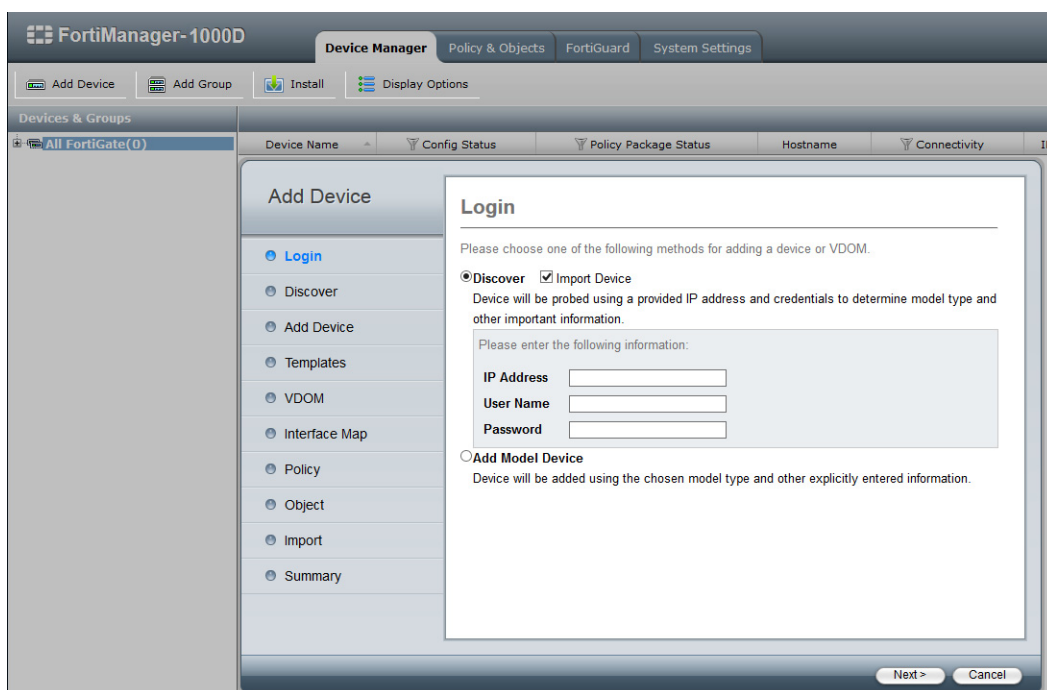

7	Hard Drive Power (Top LED)	Blue	Hard drive installed and powered.
		Off	No hard drive detected.
7	Hard Drive Status	Flashing Green	Hard drive activity.
		Red	Hard drive failure.
		Off	Hard drive is idle.

## Web-Based Manager

The FortiManager web-based manager provides GUI based access to the Module and is the primary tool for configuring the Module. The manager requires a web browser on the management computer and an Ethernet connection between the Module and the management computer.

A web-browser that supports Transport Layer Security (TLS) 1.0 is required for remote access to the web-based manager when the Module is operating in FIPS mode. HTTP access to the web-based manager is not allowed in FIPS mode and is disabled.

**Figure 5: The FortiManager web-based manager**

## Command Line Interface

The FortiManager Command Line Interface (CLI) is a full-featured, text based management tool for the Module. The CLI provides access to all of the possible services and configuration options in the Module. The CLI uses a console connection or a network (Ethernet) connection between the Module and the management computer. The console connection is a direct serial connection. Terminal emulation software is required on the management computer using either method. For network access, a Telnet or SSH client that supports the SSH v2.0 protocol is required (SSH v1.0 is not supported in FIPS mode). Telnet access to the CLI is not allowed in FIPS mode and is disabled.

## Roles, Services and Authentication

### Roles

When configured in FIPS mode, the Module provides the following roles:

- Crypto Officer
- Network User

The Crypto Officer role is initially assigned to the default 'admin' operator account. The Crypto Officer role has read-write access to all of the Module's administrative services. The initial Crypto Officer can create additional operator accounts. These additional accounts are assigned the Crypto Officer role and can be assigned a range of read/write or read only access permissions including the ability to create operator accounts.

The Module also provides a Network User role. Network Users have read/write access to a restricted set of the Module's administrative services. Network User accounts are created by Crypto Officers with the necessary permissions.

The Module does not provide a Maintenance role.

### FIPS Approved Services

The following tables detail the types of FIPS approved services available to each role in each mode of operation, the types of access for each role and the Keys or CSPs they affect.

The access types are abbreviated as follows:

<b>Read Access</b>	R
<b>Write Access</b>	W
<b>Execute Access</b>	E

**Table 4: Services available to Crypto Officers**

Service	Access	Key/CSP
authenticate to Module	WE	Crypto Officer Password, Diffie-Hellman Key, HTTP/TLS and SSH Server/Host Keys, HTTPS/TLS and SSH Session Authentication Keys, and HTTPS/TLS Session Encryption Keys, DRBG Output, DRBG Seed, DRBG Input String
show system status	WE	N/A
show FIPS mode enabled/disabled (console/CLI only)	WE	N/A
enable FIPS mode of operation (console only)	WE	Configuration Integrity Key
key zeroization (console/CLI only)	WE	All keys. (See "Key Zeroization" on page 11)
execute factory reset (disable FIPS mode, console/CLI only)	WE	All keys except firmware update key, configuration integrity key, configuration backup key
execute FIPS on-demand self-tests (console only)	E	Configuration Integrity Key, Firmware Integrity Key
add/delete operators and network users	WE	Crypto Officer Password, Network User Password
set/reset operator and network user passwords	WE	Crypto Officer Password, Network User Password

**Table 4: Services available to Crypto Officers**

Service	Access	Key/CSP
backup/restore configuration file	WE	Configuration Encryption Key, Configuration Backup Key
read/set/delete/modify Module configuration	WE	N/A
execute firmware update	E	Firmware Update Key
read log data	WE	N/A
delete log data (console/CLI only)	WE	N/A
execute system diagnostics (console/CLI only)	WE	N/A

**Table 5: Services available to Network Users**

Service/CSP	Access	Key/CSP
authenticate to Module	WE	Crypto Officer Password, Diffie-Hellman Key, HTTP/TLS and SSH Server/Host Keys, HTTPS/TLS and SSH Session Authentication Keys, and HTTPS/TLS Session Encryption Keys, DRBG Output, DRBG Seed, DRBG Input String
Firmware updates, database lookups or updates	E	Diffie-Hellman Key, HTTPS/TLS Server/Host Key, HTTPS/TLS Session Authentication Key, HTTPS/TLS Session Encryption Key, DRBG Output, DRBG Seed, DRBG Input String
show system status (console only)	WE	N/A
execute FIPS on-demand self-tests	E	Configuration Integrity Key, Firmware Integrity Key
show FIPS mode enabled/disabled (console/CLI only)	WE	N/A

## Non-FIPS Approved Services

The Module also provides the following non-FIPS approved services:

- Configuration backups using password protection
- LLTP and PPTP VPN
- All services specified in [Table 4](#) & [Table 5](#) are considered non-approved when using the following algorithms:
  - Non-compliant-strength Diffie-Hellman
  - Non-compliant-strength RSA key wrapping
  - DES
  - HMAC-MD5

The above services shall not be used in the FIPS approved mode of operation.

## Authentication

The Module implements identity based authentication. Operators must authenticate with a user-id and password combination to access the Module remotely or locally via the console. Remote operator authentication is done over HTTPS (TLS) or SSH. The password entry feedback mechanism does not provide information that could be used to guess or determine the authentication data.

The minimum password length is 8 characters when in FIPS mode (maximum password length is 32 characters). The password may contain any combination of upper- and lowercase letters, numbers, and printable symbols; allowing for 94 possible characters. The odds of correctly guessing a password are  $1/94^8$  which is significantly lower than one in a million. Recommended procedures to increase the password strength are explained in “FIPS 140-2 Compliant Operation” on page 15.

Note that operator authentication over HTTPS/SSH and using the console is subject to a limit of 3 failed authentication attempts in 1 minute; thus, the maximum number of attempts in one minute is 3. Therefore, the probability of a success with multiple consecutive attempts in a one-minute period is  $3/94^8$  which is less than 1/100,000.

## Physical Security

The Module meets FIPS 140-2 Security Level 2 requirements by using production grade components and an opaque, sealed enclosure. Access to the enclosure is restricted through the use of tamper-evident seals to secure the overall enclosure.

The seals are red wax/plastic with white lettering that reads “Fortinet Inc. Security Seal”. The seals are serialized.

The tamper seals are not applied at the factory prior to shipping. It is the responsibility of the Crypto Officer to apply the seals before use to ensure full FIPS 140-2 compliance. Once the seals have been applied, the Crypto Officer must develop an inspection schedule to verify that the external enclosure of the Module and the tamper seals have not been damaged or tampered with in any way. The Crypto Officer is required to zeroize the cryptographic module by following the steps in the Key Zeroization section of the SP. The Crypto Officer is also responsible for securing and controlling any unused seals.

The surfaces should be cleaned with 99% Isopropyl alcohol to remove dirt and oil before applying the seals. Ensure the surface is completely clean and dry before applying the seals. If a seal needs to be re-applied, completely remove the old seal and clean the surface with an adhesive remover before following the instructions for applying a new seal. The seals require a curing time of 24 hours to ensure proper adhesion.

Additional seals can be ordered through your Fortinet sales contact. Reference the SKU FIPS-SEAL-RED when ordering and specify the number of seals required.

The FortiManager-1000D uses 1 seal to secure:

- the external enclosure (1 seal, see Figure 7)

**Figure 6: FortiManager-1000D external enclosure seal, top, left**

## Operational Environment

The Module consists of the combination of the FortiManager operating system and the FortiManager appliance. The FortiManager operating system can only be installed, and run, on a FortiManager appliance. The FortiManager operating system provides a proprietary and non-modifiable operating system.

## Cryptographic Key Management

### Random Number Generation

The Module uses a firmware based, deterministic random bit generator (DRBG) that conforms to NIST Special Publication 800-90A. The Module generates cryptographic keys whose strengths are modified by available entropy. There is no assurance of the minimum strength of generated keys.

### Entropy Token

The Module uses an entropy token (part number FTR-ENT-1 or part number FTR-ENT-2) to seed the DRBG during the Module's boot process and to periodically reseed the DRBG. The entropy token is not included in the boundary of the Module and therefore no assurance can be made for the correct operation of the entropy token nor is there a guarantee of stated entropy.

The default reseed period is once every 24 hours (1440 minutes). The token must be installed to complete the boot process and to reseed of the DRBG. The entropy token is responsible for loading a minimum of 256 bits of entropy.

### Key Zeroization

The zeroization process must be performed under the direct control of the operator. The operator must be present to observe that the zeroization method has completed successfully.

All keys and CSPs are zeroized by erasing the Module's flash memory and then power cycling the Module. To erase the flash memory, execute the following command from the CLI:

```
execute erase-disk flash <erase-times>
```

## Algorithms

**Table 6: FIPS Approved Algorithms**

Algorithm	NIST Certificate Number
CTR DRBG (NIST SP 800-90A) with 256-bits	929
Triple-DES in CBC mode with 192-bits	2001
AES in CBC mode (128-, 192-, 256-bits)	3594
SHA-1	2956
SHA-256	2956
HMAC SHA-1	2291
HMAC SHA-256	2291
RSA PKCS1 -Signature Generation: 2048 and 3072-bit -Signature Verification: 1024, 2048 and 3072-bit -For legacy use, the module supports 1024-bit RSA keys and SHA-1 for signature verification	1848
CVL (SSH) - with TDES-192 bit-CBC, AES 128 bit-, AES 256 bit -CBC (using SHA1, SHA256 and SHA512)	616
CVL (TLS) - TLS1.0/1.1	616

**Table 7: FIPS Allowed Algorithms**

Algorithm
RSA (key wrapping; key establishment methodology provides 112 or 128 bits of encryption strength)
Diffie-Hellman (key agreement; key establishment methodology provides between 112 and 201 bits of encryption strength)
NDRNG (Entropy Token) - please refer to the <a href="#">"Entropy Token"</a> on page 11 for additional information.

**Table 8: Non-FIPS Approved Algorithms**

Algorithm
DES (disabled in FIPS mode)
MD5 (disabled in FIPS mode)
HMAC MD5 (disabled in FIPS mode)
RSA is non-compliant when keys less than 2048 bits are used, since such keys do not provide the minimum required 112 bits of encryption strength.
Diffie-Hellman is non-compliant when keys less than 2048 bits are used, since such keys do not provide the minimum required 112 bits of encryption strength.

Note that the SSH and TLS protocols have not been tested by the CMVP or CAVP.

## Cryptographic Keys and Critical Security Parameters

The following table lists all of the cryptographic keys and critical security parameters used by the Module. The following definitions apply to the table:

<b>Key or CSP</b>	The key or CSP description.
<b>Storage</b>	Where and how the keys are stored
<b>Usage</b>	How the keys are used
<b>Zeroization</b>	The key zeroization method

**Table 9: Cryptographic Keys and Critical Parameters used in FIPS Mode**

Key or CSP	Generation	Storage	Usage	Zeroization
Diffie-Hellman Keys	Automatic	SDRAM Plaintext	Key agreement and key establishment	By erasing the flash memory and power cycling the FortiManager unit
NDRNG output string	Automatic	Flash RAM Plain-text	Input string for the entropy pool	By erasing the flash memory and power cycling the FortiManager unit
DRBG seed	Automatic	Flash RAM Plain-text	Seed used by the DRBG (output from NDRNG)	By erasing the flash memory and power cycling the FortiManager unit
DRBG output	Automatic	Flash RAM Plain-text	Random numbers used in cryptographic algorithms	By erasing the flash memory and power cycling the FortiManager unit
DRBG v and key values	Automatic	Flash Ram Plain-text	Internal state values for the DRBG	By erasing the flash memory and power cycling the FortiManager unit
Firmware Update Key	Preconfigured	Flash RAM Plain-text	Verification of firmware integrity when updating to new firmware versions using RSA public key (firmware load test)	By erasing the flash memory and power cycling the FortiManager unit
Firmware Integrity Key	Preconfigured	Flash RAM Plain-text	Verification of firmware integrity in the firmware integrity test using RSA public key (firmware integrity test)	By erasing the flash memory and power cycling the FortiManager unit
HTTPS/TLS Server/Host Key	Preconfigured	Flash RAM Plain-text	RSA private key used in the HTTPS/TLS protocols (key establishment)	By erasing the flash memory and power cycling the FortiManager unit
HTTPS/TLS Session Authentication Key	Automatic	SDRAM Plain-text	HMAC SHA-1 or HMAC SHA-256 key used for HTTPS/TLS session authentication	By erasing the flash memory and power cycling the FortiManager unit

**Table 9: Cryptographic Keys and Critical Parameters used in FIPS Mode**

Key or CSP	Generation	Storage	Usage	Zeroization
HTTPS/TLS Session Encryption Key	Automatic	SDRAM Plain-text	AES or Triple-DES key used for HTTPS/TLS session encryption	By erasing the flash memory and power cycling the FortiManager unit
SSH Server/Host Key	Preconfigured	Flash RAM Plain-text	RSA private key used in the SSH protocol (key establishment)	By erasing the flash memory and power cycling the FortiManager unit
SSH Session Authentication Key	Automatic	SDRAM Plain-text	HMAC SHA-1 or HMAC SHA-256 key used for SSH session authentication	By erasing the flash memory and power cycling the FortiManager unit
SSH Session Encryption Key	Automatic	SDRAM Plain-text	AES or Triple-DES key used for SSH session encryption	By erasing the flash memory and power cycling the FortiManager unit
Crypto Officer Password	Manual	Flash RAM SHA-1 hash	Used to authenticate operator access to the Module	By erasing the flash memory and power cycling the FortiManager unit
Configuration Integrity Key	Preconfigured	Flash RAM Plain-text	HMAC SHA-256 hash used for configuration integrity test	By erasing the flash memory and power cycling the FortiManager unit
Configuration Encryption Key	Automatic	Flash RAM Plain-text	AES key used to encrypt CSPs on the flash RAM and in the backup configuration file (except for crypto officer passwords in the backup configuration file)	By erasing the flash memory and power cycling the FortiManager unit
Configuration Backup Key	Automatic	Flash RAM Plain-text	HMAC SHA-256 key used to encrypt crypto officer passwords in the backup configuration file	By erasing the flash memory and power cycling the FortiManager unit
Network User Password	Manual	Flash RAM SHA-1 hash	Used to authenticate network access to the Module	By erasing the flash memory and power cycling the FortiManager unit

**Note:** The Generation column lists all of the keys/CSPs and their entry/generation methods. Manual entered keys are entered by the operator electronically (as defined by FIPS) using the console or a management computer. Pre-configured keys are set as part of the firmware (hardcoded) and are not operator modifiable. Automatic keys are generated as part of the associated protocol.

## Key Archiving

The Module supports key archiving to a management computer as part of the Module configuration file backup. Operator entered keys are archived as part of the Module configuration file. The configuration file is stored in plain text, but keys in the configuration file are either AES encrypted using the Configuration Encryption Key or stored as a keyed hash using HMAC-SHA-1 using the Configuration Backup Key.

## Electromagnetic Interference/Electromagnetic Compatibility (EMI/EMC)

The Module complies with EMI/EMC requirements for Class A (business use) devices as specified by Part 15, Subpart B, of the FCC rules. The following table lists the specific lab and FCC report information for the Module.

**Table 10: FCC Report Information**

Module	Lab Information	FCC Report Number
FMG-1000D	Bay Area Compliance Laboratories Corp. 1274 Anvilwood Ave. Sunnyvale, CA, 94089 Tel (408) 732-9162 Fax (408) 732-9164	R1406173-15

## Mitigation of Other Attacks

The Module does not mitigate against any other attacks.

## FIPS 140-2 Compliant Operation

FIPS 140-2 compliant operation requires both that you use the Module in its FIPS mode of operation and that you follow secure procedures for installation and operation of the Module

. You must ensure that:

- The Module is configured in the FIPS mode of operation.
- The Module is installed in a secure physical location.
- Physical access to the Module is restricted to authorized operators.
- A USB entropy token is used to seed the DRBG
- The token remains in the USB port during operation
- Administrative passwords are at least 8 characters long.
- Administrative passwords are changed regularly.
- Administrator account passwords must have the following characteristics:
  - One (or more) of the characters must be capitalized
  - One (or more) of the characters must be numeric
  - One (or more) of the characters must be non alpha-numeric (e.g. punctuation mark)
- Administration of the Module is permitted using only validated administrative methods. These are:
  - Console connection
  - Web-based manager via HTTPS
  - Command line interface (CLI) access via SSH
- Diffie-Hellman groups of less than 2048 bits are not used.
- Client side RSA certificates must use 2048 bit or greater key sizes.
- Only approved and allowed algorithms are used (see [“Algorithms” on page 12](#)).

The Module can be used in either of its two operation modes: NAT/Route or Transparent. NAT/Route mode applies security features between two or more different networks (for example, between a private network and the Internet). Transparent mode applies security features at any point in a network. The current operation mode is displayed on the web-based manager Status page and in the output of the `get system status` CLI command.

## Enabling FIPS mode

To enable the FIPS 140-2 compliant mode of operation, the operator must execute the following command from the Local Console:

```
config system fips
  set status enable
end
```

The Operator is required to supply a password for the admin account which will be assigned to the Crypto Officer role.

The supplied password must be at least 8 characters long and correctly verified before the system will restart in FIPS mode.

Upon restart, the Module will execute self-tests to ensure the correct initialization of the Module's cryptographic functions.

After restarting, the Crypto Officer can confirm that the Module is running in FIPS mode by executing the following command from the CLI:

```
get system status
```

If the Module is running in FIPS mode, the system status output will display the line:

```
FIPS mode: enable
```

**Note:** Enabling/disabling the FIPS mode of operation will automatically invoke the key zeroization service. The key zeroization is performed immediately after FIPS mode is enabled/disabled. Additionally, certain non-FIPS approved services may still be available, but they shall not be used in the FIPS approved mode of operation.

## Self-Tests

The Module executes the following self-tests during startup and initialization:

- Firmware integrity test using RSA signatures
- Configuration integrity test using HMAC SHA-1
- Triple-DES, CBC mode, encrypt known answer test
- Triple-DES, CBC mode, decrypt known answer test
- AES, CBC mode, encrypt known answer test
- AES, CBC mode, decrypt known answer test
- HMAC SHA-1 known answer test
- SHA-1 known answer test (test as part of HMAC SHA-1 known answer test)
- HMAC SHA-256 known answer test
- SHA-256 known answer test (test as part of HMAC SHA-256 known answer test)
- RSA signature generation known answer test
- RSA signature verification known answer test
- DRBG known answer test

The results of the startup self-tests are displayed on the console during the startup process. The startup self-tests can also be initiated on demand using the CLI command **execute fips kat all** (to initiate all self-tests) or **execute fips kat <test>** (to initiate a specific self-test).

When the self-tests are run, each implementation of an algorithm is tested - e.g. when the AES self-test is run, all AES implementations are tested.

The Module executes the following conditional tests when the related service is invoked:

- Continuous NDRNG test
- Continuous DRBG test
- RSA pairwise consistency test
- Configuration integrity test using HMAC SHA-1
- Firmware load test using RSA signatures

If any of the self-tests or conditional tests fail, the Module enters an error state as shown by the console output below:

```
FIPS error: <Alg> test failed
Entering error mode...
```

All data output and cryptographic services are inhibited in the error state.
