1 General

1.1 Overview

This document is the non-proprietary FIPS 140-3 Security Policy for version AWS-LC FIPS 3.1.0 of the AWS-LC 3 Cryptographic Module (dynamic). It contains the security rules under which the module must operate and describes how this module meets the requirements as specified in FIPS PUB 140-3 (Federal Information Processing Standards Publication 140-3) for an overall Security Level 1 module.

1.2 Security Levels

Section	Title	Security Level
1	General	1
2	Cryptographic module specification	1
3	Cryptographic module interfaces	1
4	Roles, services, and authentication	1
5	Software/Firmware security	1
6	Operational environment	1
7	Physical security	N/A
8	Non-invasive security	N/A
9	Sensitive security parameter management	1
10	Self-tests	1
11	Life-cycle assurance	1
12	Mitigation of other attacks	1
	Overall Level	1

Table 1: Security Levels

1.3 Additional Information

This Security Policy describes the features and design of the module named AWS-LC 3 Cryptographic Module (dynamic) using the terminology contained in the FIPS 140-3 specification. The FIPS 140-3 Security Requirements for Cryptographic Module specifies the security requirements that will be satisfied by a cryptographic module utilized within a security system protecting sensitive but unclassified information. The NIST/CCCS Cryptographic Module Validation Program (CMVP) validates cryptographic module to FIPS 140-3. Validated products are accepted by the Federal agencies of both the USA and Canada for the protection of sensitive or designated information.

This Non-Proprietary Security Policy may be reproduced and distributed, but only whole and intact and including this notice. Other documentation is proprietary to their authors.

In preparing the Security Policy document, the laboratory formatted the vendor-supplied documentation for consolidation without altering the technical statements therein contained. The further refining of the Security Policy document was conducted iteratively throughout the conformance testing, wherein the Security Policy was submitted to the vendor, who would then edit, modify, and add technical contents. The vendor would also supply additional documentation, which the laboratory formatted into the existing Security Policy, and resubmitted to the vendor for their final editing.

2 Cryptographic Module Specification

2.1 Description

Purpose and Use:

The AWS-LC 3 Cryptographic Module (dynamic) (hereafter referred to as “the module”) provides cryptographic services to applications running in the user space of the underlying operating system through a C language Application Program Interface (API).

Module Type: Software

Module Embodiment: Multi-Chip Standalone

Cryptographic Boundary:

The block diagram in Figure 1 shows the cryptographic boundary of the module, its interfaces with the operational environment and the flow of information between the module and operator (depicted through the arrows).

The cryptographic boundary is defined as the AWS-LC 3 Cryptographic Module (dynamic) which is a cryptographic library consisting of the bcm.o file (version AWS-LC FIPS 3.1.0). This file is dynamically linked to the userspace application during the compilation process.

Tested Operational Environment’s Physical Perimeter (TOEPP):

The PAA provided by the processor is located within the module’s physical perimeter and outside of the module’s cryptographic boundary.

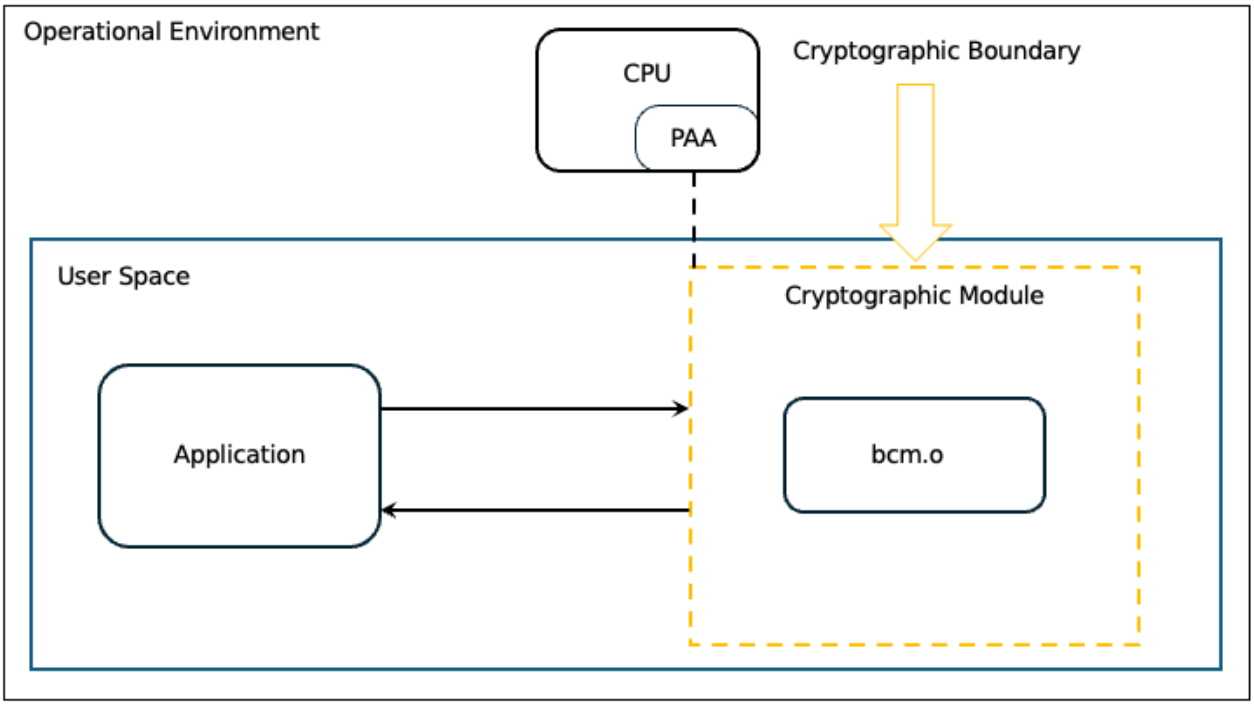

Figure 1: Block Diagram

2.2 Tested and Vendor Affirmed Module Version and Identification

Tested Module Identification – Hardware:

N/A for this module.

Tested Module Identification – Software, Firmware, Hybrid (Executable Code Sets):

Package or File Name	Software/ Firmware Version	Features	Integrity Test
bcm.o on Amazon Linux 2023 on Graviton4 on r8g.metal-24xl	AWS-LC FIPS 3.1.0	N/A	HMAC-SHA2-256
bcm.o on Amazon Linux 2023 on Intel Xeon Platinum 8375C on c6i.metal	AWS-LC FIPS 3.1.0	N/A	HMAC-SHA2-256

Table 2: Tested Module Identification – Software, Firmware, Hybrid (Executable Code Sets)

Tested Module Identification – Hybrid Disjoint Hardware:

N/A for this module.

Tested Operational Environments - Software, Firmware, Hybrid:

Operating System	Hardware Platform	Processors	PAA/PAI	Hypervisor or Host OS	Version(s)
Amazon Linux 2023	r8g.metal-24xl	Graviton4 (ARMv9)	Yes	N/A	AWS-LC FIPS 3.1.0
Amazon Linux 2023	c6i.metal	Intel Xeon Platinum 8375C (AES-NI)	Yes	N/A	AWS-LC FIPS 3.1.0
Amazon Linux 2023	r8g.metal-24xl	Graviton4 (ARMv9)	No	N/A	AWS-LC FIPS 3.1.0
Amazon Linux 2023	c6i.metal	Intel Xeon Platinum 8375C (AES-NI)	No	N/A	AWS-LC FIPS 3.1.0

Table 3: Tested Operational Environments - Software, Firmware, Hybrid

Vendor-Affirmed Operational Environments - Software, Firmware, Hybrid:

N/A for this module.

CMVP makes no statement as to the correct operation of the module or the security strengths of the generated keys when so ported if the specific operational environment is not listed on the validation certificate.

2.3 Excluded Components

The module does not claim any excluded components.

2.4 Modes of Operation

Modes List and Description:

Mode Name	Description	Type	Status Indicator
Approved Mode	Automatically entered whenever an approved service is requested.	Approved	Return value 1 from the API call sequence specified in section 4.3.
Non-approved Mode	Automatically entered whenever a non-approved service is requested.	Non-Approved	Return value 0 from the API call sequence specified in section 4.3.

Table 4: Modes List and Description

Mode Change Instructions and Status:

When the module starts up successfully, after passing the pre-operational self-test and the cryptographic algorithms self-tests (CASTs), the module is operating in the approved mode of operation by default and can only be transitioned into the non-approved mode by calling one of the non-approved services listed in the *Non-Approved Services* table. The module will transition back to approved mode when approved service is called. Section 4.3 provides details on the service indicator implemented by the module. The service indicator identifies when an approved service is called.

Degraded Mode Description:

The module does not implement a degraded mode of operation.

2.5 Algorithms

Approved Algorithms:

Algorithm	CAVP Cert	Properties	Reference
AES-CBC	A6160, A6165, A6170, A6181, A6273, A6276	Direction - Decrypt, Encrypt Key Length - 128, 192, 256	SP 800-38A
AES-CCM	A6160, A6165, A6170, A6181, A6273, A6276	Key Length - 128	SP 800-38C
AES-CMAC	A6160, A6165, A6170, A6181, A6273, A6276	Direction - Generation, Verification Key Length - 128, 256	SP 800-38B
AES-CTR	A6160, A6165, A6170, A6181, A6273, A6276	Direction - Decrypt, Encrypt Key Length - 128, 192, 256	SP 800-38A
AES-ECB	A6160, A6161, A6162, A6163, A6164, A6165, A6166, A6167, A6168, A6169, A6170, A6171, A6172, A6173, A6174, A6181, A6182, A6273, A6274, A6275, A6276, A6277	Direction - Decrypt, Encrypt Key Length - 128, 192, 256	SP 800-38A
AES-GCM	A6161, A6162, A6163, A6164, A6166, A6167, A6168, A6169, A6171, A6172, A6173, A6174, A6182, A6274, A6275, A6277	Direction - Decrypt, Encrypt IV Generation - External, Internal Key Length - 128, 256 IV Generation Mode - 8.2.1, 8.2.2	SP 800-38D

Algorithm	CAVP Cert	Properties	Reference
AES-GMAC	A6161, A6162, A6163, A6164, A6166, A6167, A6168, A6169, A6171, A6172, A6173, A6174, A6182, A6274, A6275, A6277	Direction - Decrypt, Encrypt IV Generation - External, Internal Key Length - 128, 256 IV Generation Mode - 8.2.1, 8.2.2	SP 800-38D
AES-KW	A6160, A6165, A6170, A6181, A6273, A6276	Direction - Decrypt, Encrypt Key Length - 128, 192, 256	SP 800-38F
AES-KWP	A6160, A6165, A6170, A6181, A6273, A6276	Direction - Decrypt, Encrypt Key Length - 128, 192, 256	SP 800-38F
AES-XTS Testing Revision 2.0	A6160, A6165, A6170, A6175, A6181, A6273, A6276	Direction - Decrypt, Encrypt Key Length - 256	SP 800-38E
Counter DRBG	A6181, A6273, A6276	Prediction Resistance - No Mode - AES-256 Derivation Function Enabled - No	SP 800-90A Rev. 1
Counter DRBG	A8121, A8122, A8123, A8124	Prediction Resistance - No Mode - AES-256 Derivation Function Enabled - Yes	SP 800-90A Rev. 1
ECDSA KeyGen (FIPS186-5)	A6176, A6177, A6178, A6179, A6180, A6184, A6278, A6279	Curve - P-224, P-256, P-384, P-521 Secret Generation Mode - testing candidates	FIPS 186-5
ECDSA KeyVer (FIPS186-5)	A6176, A6177, A6178, A6179, A6180, A6184, A6278, A6279	Curve - P-224, P-256, P-384, P-521	FIPS 186-5
ECDSA SigGen (FIPS186-5)	A6176, A6177, A6178, A6179, A6180, A6184, A6278, A6279	Curve - P-224, P-256, P-384, P-521 Hash Algorithm - SHA2-224, SHA2-256, SHA2-384, SHA2-512, SHA2-512/224, SHA2-512/256, SHA3-224, SHA3-256, SHA3-384, SHA3-512 Component - No	FIPS 186-5
ECDSA SigVer (FIPS186-4)	A6176, A6177, A6178, A6179, A6180, A6184, A6278, A6279	Component - No Curve - P-224, P-256, P-384, P-521 Hash Algorithm - SHA-1	FIPS 186-4
ECDSA SigVer (FIPS186-5)	A6176, A6177, A6178, A6179, A6180, A6184, A6278, A6279	Curve - P-224, P-256, P-384, P-521 Hash Algorithm - SHA2-224, SHA2-256, SHA2-384, SHA2-512, SHA2-512/224, SHA2-512/256, SHA3-224, SHA3-256, SHA3-384, SHA3-512	FIPS 186-5
EDDSA KeyGen	A6176, A6177, A6178, A6179, A6180, A6184, A6278, A6279	Curve - ED-25519	FIPS 186-5
EDDSA SigGen	A6176, A6177, A6178, A6179, A6180, A6184, A6278, A6279	Curve - ED-25519	FIPS 186-5
EDDSA SigVer	A6176, A6177, A6178, A6179, A6180, A6184, A6278, A6279	Curve - ED-25519	FIPS 186-5
HMAC-SHA-1	A6176, A6177, A6178, A6179, A6180, A6184, A6278, A6279	Key Length - Key Length: 112-524288 Increment 8	FIPS 198-1

SHA3-224	A6183	Message Length - Message Length: 0-65536 Increment 8 Large Message Sizes - 1, 2, 4, 8	FIPS 202
SHA3-256	A6183	Message Length - Message Length: 0-65536 Increment 8 Large Message Sizes - 1, 2, 4, 8	FIPS 202
SHA3-384	A6183	Message Length - Message Length: 0-65536 Increment 8 Large Message Sizes - 1, 2, 4, 8	FIPS 202
SHA3-512	A6183	Message Length - Message Length: 0-65536 Increment 8 Large Message Sizes - 1, 2, 4, 8	FIPS 202
SHAKE-128	A6183	Output Length - Output Length: 16-65536 Increment 8	FIPS 202
SHAKE-256	A6183	Output Length - Output Length: 16-65536 Increment 8	FIPS 202

Table 5: Approved Algorithms

Vendor-Affirmed Algorithms:

Name	Properties	Implementation	Reference
Asymmetric Cryptographic Key Generation (CKG)	Key Type:Asymmetric	N/A	SP 800-133Rev2 section 4, example 1

Table 6: Vendor-Affirmed Algorithms

Non-Approved, Allowed Algorithms:

N/A for this module.

The module does not implement non-approved algorithms that are allowed in the approved mode of operation.

Non-Approved, Allowed Algorithms with No Security Claimed:

Name	Caveat	Use and Function
MD5	Allowed per IG 2.4.A	Message Digest used in TLS 1.0/1.1 KDF only

Table 7: Non-Approved, Allowed Algorithms with No Security Claimed

Non-Approved, Not Allowed Algorithms:

Name	Use and Function
AES with OFB or CFB1, CFB8, CFB128 modes	Encryption, Decryption (not CAVP tested)
AES GCM, GCM, GMAC, XTS with keys not listed in Table 5	Encryption, Decryption
AES using aes_*_generic function	Encryption, Decryption (not CAVP tested)
RSA encryption primitive with PKCS#1 v1.5 and OAEP padding	Encryption
AES GMAC using aes_*_generic	Message Authentication Generation (not CAVP tested)
Curve secp256k1	Signature Generation, Signature Verification, Shared Secret Computation
Diffie Hellman	Shared Secret Computation (not CAVP tested)
HMAC-MD4, HMAC-MD5, HMAC-SHA-3, HMAC-RIPEMD-160	Message Authentication Generation (not CAVP tested)
MD4	Message Digest
MD5 (outside of TLS)	Message Digest
RIPEMD-160	Message Digest
RSA using RSA_generate_key_ex	Key Generation (not complaint with FIPS186-5)
ECDSA using EC_KEY_generate_key	Key Generation (not complaint with FIPS186-5)
RSA using keys less than 2048 bits	Signature Generation
SHA-1	Signature Generation
RSA using keys less than 1024 bits	Signature Verification
RSA without hashing	Sign/Verify primitive operations
TLS KDF using any SHA algorithms other than SHA2-256, SHA2-384, SHA2-512; or TLS KDF using non-extended master secret	Key Derivation
RSA	Key Encapsulation/Un-encapsulation (not compliant with SP 800-56BRev2)

Table 8: Non-Approved, Not Allowed Algorithms

2.6 Security Function Implementations

Name	Type	Description	Properties	Algorithms
KAS-ECC-SSC (Shared Secret Computation with EC Diffie-Hellman)	KAS-SSC	SP800-56Arev3. Shared secret computation	IG D.F:KAS-ECC-SSC per scenario 2 path (1)	KAS-ECC-SSC Sp800-56Ar3: (A6176, A6177, A6178, A6179, A6180, A6184, A6279, A6278)
Encryption/Decryption with AES	BC-UnAuth	SP800-38A and SP 800-38E. Encryption and Decryption		AES-CBC: (A6160, A6165, A6170, A6181, A6273, A6276) AES-CTR: (A6160, A6165, A6170, A6181, A6273, A6276) AES-ECB: (A6160, A6161, A6162, A6163, A6164, A6165, A6166, A6167, A6168, A6169, A6170, A6171, A6172, A6173, A6174, A6181, A6182, A6273, A6274, A6275, A6276, A6277) AES-XTS Testing Revision 2.0: (A6160, A6165, A6170, A6175, A6181, A6273, A6276)
Signature Generation with RSA	DigSig-SigGen	FIPS186-5. Digital signature generation	IG C.F:RSA SigGen was CAVP tested with moduli sizes 2048, 3072, 4096 bits. The module supports moduli sizes larger than 4096 bits.	RSA SigGen (FIPS186-5): (A6176, A6177, A6178, A6179, A6180, A6184, A6279, A6280, A6278)
Signature Generation with ECDSA	DigSig-SigGen	FIPS186-5. Digital signature generation		ECDSA SigGen (FIPS186-5): (A6176, A6177, A6178, A6179, A6180, A6184, A6278, A6279)

Table 9: Security Function Implementations

2.7 Algorithm Specific Information

GCM IV

The module offers three AES GCM implementations. The GCM IV generation for these implementations complies respectively with IG C.H under Scenario 1, Scenario 2, and Scenario 5. The GCM shall only be used in the context of the AES-GCM encryption executing under each scenario, and using the referenced APIs explained next.

Scenario 1, TLS 1.2

For TLS 1.2, the module offers the GCM implementation and uses the context of Scenario 1 of IG C.H. The module is compliant with SP800-52rev2 and the mechanism for IV generation is compliant with RFC5288. The module supports acceptable AES-GCM ciphersuites from Section 3.3.1 of SP800-52rev2.

The module explicitly ensures that the counter (the nonce_explicit part of the IV) does not exhaust the maximum number of possible values of 2^{64-1} for a given session key. If this

exhaustion condition is observed, the module returns an error indication to the calling application, which will then need to either abort the connection, or trigger a handshake to establish a new encryption key.

In the event the module's power is lost and restored, the consuming application must ensure that a new key for use with the AES-GCM key encryption or decryption under this scenario shall be established.

Scenario 2, Random IV

In this implementation, the module offers the interfaces EVP_aead_aes_128_gcm_randnonce() and EVP_aead_aes_256_gcm_randnonce() for compliance with Scenario 2 of IG C.H and SP800-38D Section 8.2.2. The 96-bit AES-GCM IV, containing 96 bits of entropy, is generated randomly internal to the module using module's approved DRBG, without outputting the IV to the calling application. The DRBG is seeded from the entropy source.

Scenario 5, TLS 1.3

August 2018, using the ciphersuites that explicitly select AES-GCM as the encryption/decryption cipher (Appendix B.4 of RFC8446). The module supports acceptable AES-GCM ciphersuites from Section 3.3.1 of SP800-52rev2.

The module implements, within its boundary, an IV generation unit for TLS 1.3 that keeps control of the 64-bit counter value within the AES-GCM IV. If the exhaustion condition is observed, the module will return an error indication to the calling application, who will then need to either trigger a re-key of the se ssion (i.e., a new key for AES-GCM), or terminate the connection.

In the event the module's power is lost and restored, the consuming application must ensure that new AES-GCM keys encryption or decryption under this scenario are established. TLS 1.3 provides session resumption, but the resumption procedure derives new AES-GCM encryption keys.

AES XTS

The length of a single data unit encrypted or decrypted with AES XTS shall not exceed 2^{20} AES blocks, that is 16MB, of data per XTS instance. An XTS instance is defined in Section 4 of SP 800-38E. The XTS mode shall only be used for the cryptographic protection of data on storage devices. It shall not be used for other purposes, such as the encryption of data in transit. To meet the requirement stated in IG C.I, the module implements the check to ensure that the two AES keys used in XTS-AES algorithm are not identical. The two XTS keys shall be generated and/or established independently according to the rules for component symmetric keys from NIST SP 800-133Rev2, Sec. 6.3.

Key Derivation using SP 800-132 PBKDF2

The module provides password-based key derivation (PBKDF2), compliant with SP 800-132. The module supports option 1a from Section 5.4 of SP 800-132, in which the Master Key (MK) or a segment of it is used directly as the Data Protection Key (DPK). In accordance with SP 800-132 and FIPS 140-3 IG D.N, the following requirements shall be met:

- Derived keys shall only be used in storage applications. The MK shall not be used for other purposes. The module accepts a minimum length of 112 bits for the MK or DPK.
- Passwords or passphrases, used as an input for the PBKDF2, shall not be used as cryptographic Keys.

- The minimum length of the password or passphrase accepted by the module is 14 characters. This results in the estimated probability of guessing the password to be at most 10^{-14}. Combined with the minimum iteration count as described below, this provides an acceptable trade-off between user experience and security against brute-force attacks.
- A portion of the salt, with a length of at least 128 bits (this is verified by the module to determine the service is approved), shall be generated randomly using the SP 800-90Ar1 DRBG provided by the module.
- The iteration count shall be selected as large as possible, if the time required to generate the key using the entered password is acceptable for the users. The module restricts the minimum iteration count to be 1000.

Compliance to SP 800-56ARev3 assurances

The module offers ECDH shared secret computation services compliant to the SP 800-56ARev3 and meeting IG D.F scenario 2 path (1). To meet the required assurances listed in section 5.6 of SP 800-56ARev3, the module shall be used together with an application that implements the “TLS protocol” and the following steps shall be performed.

- The entity using the module, must use the module's "Key Pair Generation" service for generating ECDH ephemeral keys. This meets the assurances required by key pair owner defined in the section 5.6.2.1 of SP 800-56ARev3.
- As part of the module's shared secret computation (SSC) service, the module internally performs the public key validation on the peer's public key passed in as input to the SSC function. This meets the public key validity assurance required by the sections 5.6.2.2.1/5.6.2.2.2 of SP 800-56Arev3.
- The module does not support static keys therefore the "assurance of peer's possession of private key" is not applicable.

Legacy Algorithms

According to IG C.M, FIPS 186-4 RSA and ECDSA digital signature verification is approved for legacy usage only.

SHA-1 is only approved when used for message digest and for signature verification as a legacy option. The use of SHA-1 for digital signature generation is non-approved. Starting January 1 of 2031 SHA-1 will be non-approved for all purposes.

The CAVP certificates for the legacy algorithms are listed in the *Approved Algorithms* table. The legacy algorithms can only be used on data that was generated prior to the Legacy Date specified in FIPS 140-3 IG C.M.

Authenticated Encryption/Decryption

The module does not establish SSPs using an approved key transport scheme (KTS). However, it does offer approved authenticated algorithms that can be used by an external operator/application as part of an approved KTS. The authenticated algorithms are specified in the *Security Function Implementations* table.

KAS-SSC

The module does not establish SSPs using an approved key agreement scheme (KAS). However, it does offer some or all of the underlying KAS cryptographic functionality to be used by an external operator/application as part of an approved KAS. The algorithms

offering KAS cryptographic functionality are specified in the *Security Function Implementations* table.

SHA-3

SHA-3 is implemented as a standalone message digest algorithm and as part of the approved higher-level algorithms RSA SigGen/SigVer, ECDSA SigGen/SigVer, and KDA OneStep. Per IG C.C requirements, all SHA-3 functions and the higher-level algorithms that use SHA-3 have been tested and validated on all of the module's operating environments. The applicable CAVP certificates are listed in the *Approved Algorithms* table.

ML-KEM

The module does not establish SSPs using an approved key encapsulation mechanism (KEM). However, it does offer some or all of the underlying KEM cryptographic functionality to be used by an external operator/application as part of an approved KEM.

2.8 RBG and Entropy

N/A for this module.

N/A for this module.

The module provides an SP800-90Arev1-compliant Deterministic Random Bit Generator (DRBG) using CTR_DRBG mechanism with AES-256, with a derivation function, for generation of key components of asymmetric keys, and random number generation. The DRBG is seeded with 256-bit of entropy input provided from an external entity to the module. This corresponds to scenario 2 (b) of IG 9.3.A i.e., DRBG receives a LOAD command from external entropy source outside of module's cryptographic boundary. The calling application shall use an entropy source that meets the security strength required for the CTR_DRBG as shown in NIST SP 800-90Arev1, Table 3 and should return an error if minimum strength cannot be met.

Per the IG 9.3.A requirement, the module includes the caveat "No assurance of the minimum strength of generated keys".

2.9 Key Generation

The key generation methods implemented by the module are specified in the *Vendor-Affirmed Algorithms* table. The key derivation methods implemented by the module are specified in the *Security Function Implementations* table.

2.10 Key Establishment

The module implements SSP agreement and SSP transport methods as listed in the *Security Function Implementations* table.

2.11 Industry Protocols

The module implements the SSH key derivation function for use in the SSH protocol (RFC 4253 and RFC 6668).

GCM with internal IV generation in the approved mode is compliant with versions 1.2 and 1.3 of the TLS protocol (RFC 5288 and 8446) and shall only be used in conjunction with the TLS protocol. Additionally, the module implements the TLS 1.2 and TLS 1.3 key derivation functions for use in the TLS protocol.

No parts of the SSH, TLS, other than those mentioned above, have been tested by the CAVP and CMVP.

3 Cryptographic Module Interfaces

3.1 Ports and Interfaces

Physical Port	Logical Interface(s)	Data That Passes
N/A	Data Input	API input parameters for data.
N/A	Data Output	API output parameters for data.
N/A	Control Input	API function calls.
N/A	Status Output	API return codes, error message.

Table 10: Ports and Interfaces

As a Software module, the module interfaces are defined as Software or Firmware Module Interfaces (SMFI), and there are no physical ports. The module does not implement a control output interface.

4 Roles, Services, and Authentication

4.1 Authentication Methods

N/A for this module.

The module does not support authentication.

4.2 Roles

Name	Type	Operator Type	Authentication Methods
Crypto Officer	Role	CO	None

Table 11: Roles

The module does not support concurrent operators.

4.3 Approved Services

Name	Description	Indicator	Inputs	Outputs	Security Functions	SSP Access
Encryption	Encryption	1	AES key, plaintext	Ciphertext	Encryption/Decryption with AES	Crypto Officer - AES Key: W,E
Decryption	Decryption	1	AES key, ciphertext	Plaintext	Encryption/Decryption with AES	Crypto Officer - AES Key: W,E

Name	Description	Indicator	Inputs	Outputs	Security Functions	SSP Access
					Generation with AES Authenticated Encryption/Decryption with AES CCM Authenticated Encryption/Decryption with AES GCM Authenticated Encryption/Decryption with AES KW/KWP Signature Verification with RSA (Legacy) Signature Verification with ECDSA (Legacy)	

Table 12: Approved Services

For the above table, the convention below applies when specifying the access permissions (types) that the service has for each SSP.

- R = Read: The SSP is read from the module (e.g., the SSP is output).
- W = Write: The SSP is updated, imported, or written to the module.
- E = Execute: The module uses the SSP in performing a cryptographic operation.
- Z = Zeroize: The module zeroizes the SSP.

For the role, CO indicates “Crypto Officer”.

The module implements a service indicator that indicates whether the invoked service is approved. The service indicator is a return value 1 from the FIPS_service_indicator_check_approved function. This function is used together with two other functions. The usage is as follows:

- STEP 1: Should be called before invoking the service.

  int before = FIPS_service_indicator_before_call();
- STEP 2: Make a service call i.e., API function for performing a service.

  Func();
- STEP 3: Should be called after invoking the service.

  int after = FIPS_service_indicator_after_call();
- STEP 4: Return value 1 indicates approved service was invoked.

  int ret = FIPS_service_indicator_check_approved(before, after);

Alternatively, all the above steps can be done by using a single call using the function CALL_SERVICE_AND_CHECK_APPROVED(approved, func) that both executes the requested service and retrieves the corresponding service indicator. The output parameter “approved” is set to 1 if the executed service is approved or else its set to 0.

4.4 Non-Approved Services

Name	Description	Algorithms	Role
Encryption	Encryption	AES with OFB or CFB1, CFB8, CFB128 modes AES GCM, GCM, GMAC, XTS with keys not listed in Table 5 AES using aes_*_generic function RSA encryption primitive with PKCS#1 v1.5 and OAEP padding AES GMAC using aes_*_generic	CO
Decryption	Decryption	AES with OFB or CFB1, CFB8, CFB128 modes AES GCM, GCM, GMAC, XTS with keys not listed in Table 5 AES using aes_*_generic function AES GMAC using aes_*_generic	CO
Message Authentication Generation	MAC computation	AES using aes_*_generic function HMAC-MD4, HMAC-MD5, HMAC-SHA-3, HMAC-RIPEMD-160	CO
Message Digest	Generating message digest	MD4 MD5 (outside of TLS) RIPEMD-160	CO
Signature Generation	Generating signatures	RSA using keys less than 2048 bits RSA without hashing SHA-1	CO
Signature Verification	Verifying signatures	RSA using keys less than 1024 bits RSA without hashing	CO
Key Generation	Generating key pair	RSA using RSA_generate_key_ex ECDSA using EC_KEY_generate_key	CO
Shared Secret Computation	Calculating shared secret	Curve secp256k1 Diffie Hellman	CO
Key Derivation	Deriving TLS keys	TLS KDF using any SHA algorithms other than SHA2-256, SHA2-384, SHA2-512; or TLS KDF using non-extended master secret	CO
Key Encapsulation	Encrypting a key	RSA	CO
Key Un-encapsulation	Decrypting a key	RSA	CO

Table 13: Non-Approved Services

4.5 External Software/Firmware Loaded

The module does not support loading of external software or firmware.

5 Software/Firmware Security

5.1 Integrity Techniques

The integrity of the module is verified by comparing a HMAC value calculated at run time on the bcm.o file, with the HMAC-SHA2-256 value stored within the module that was computed at build time.

5.2 Initiate on Demand

The module provides on-demand integrity test. The integrity test can be performed on demand by reloading the module. Additionally, the integrity test can be performed using the On-Demand Integrity Test service, which calls the BORINGSSL_integrity_test function.

6 Operational Environment

6.1 Operational Environment Type and Requirements

Type of Operational Environment: Modifiable

How Requirements are Satisfied:

The module should be compiled and installed as stated in section 11. The user should confirm that the module is installed correctly by following steps 4 and 5 listed in section 11.

6.2 Configuration Settings and Restrictions

Instrumentation tools like the ptrace system call, gdb and strace, userspace live patching, as well as other tracing mechanisms offered by the Linux environment such as ftrace or systemtap, shall not be used in the operational environment. The use of any of these tools implies that the cryptographic module is running in a non-validated operational environment.

7 Physical Security

The module is comprised of software only and therefore this section is not applicable.

8 Non-Invasive Security

8.1 Mitigation Techniques

The module claims no non-invasive security techniques.

9 Sensitive Security Parameters Management

9.1 Storage Areas

Storage Area Name	Description	Persistence Type
RAM	Temporary storage for SSPs used by the module as part of service execution. The module does not perform persistent storage of SSPs	Dynamic

Table 14: Storage Areas

9.2 SSP Input-Output Methods

Name	From	To	Format Type	Distribution Type	Entry Type	SFI or Algorithm
API input parameters	Operator calling application (TOEPP)	Cryptographic module	Plaintext	Manual	Electronic	
API output parameters	Cryptographic module	Operator calling application (TOEPP)	Plaintext	Manual	Electronic	

Table 15: SSP Input-Output Methods

The module does not support entry and output of SSPs beyond the physical perimeter of the operational environment. The SSPs are provided to the module via API input parameters in the plaintext form and output via API output parameters in the plaintext form to and from the calling application running on the same operational environment.

9.3 SSP Zeroization Methods

Zeroization Method	Description	Rationale	Operator Initiation
Free Cipher Handle	Zeroizes the SSPs contained within the cipher handle	Memory occupied by SSPs is overwritten with zeros, which renders the SSP values irretrievable. The successful completion of the zeroization routine indicates that the zeroization procedure succeeded.	By calling the appropriate zeroization functions: OpenSSL_cleanse, EVP_CIPHER_CTX_cleanup, EVP_AEAD_CTX_zero, HMAC_CTX_cleanup, CTR_DRBG_clear, RSA_free, EC_KEY_free, KEM_KEY_free, EVP_PKEY_free
Module Reset	De-allocates the volatile memory used to store SSPs	Volatile memory used by the module is overwritten within nanoseconds when power is removed. The successful completion of the removal of power from the module indicates that zeroization has completed.	By unloading and reloading the module.
Automatically	Automatically zeroized when no longer needed	Memory occupied by SSPs is overwritten with zeros, which renders the SSP values irretrievable. The	N/A

Zeroization Method	Description	Rationale	Operator Initiation
		successful completion of the running service indicates that zeroization has completed.	

Table 16: SSP Zeroization Methods

All data output via the data output interface is inhibited when the module is performing zeroization.

9.4 SSPs

Name	Description	Size - Strength	Type - Category	Generated By	Established By	Used By
AES Key	AES key used for encryption, decryption, and computing MAC tags	128-256 bits - 128-256 bits	Symmetric key - CSP			Encryption/Decryption with AES Message Authentication Generation with AES Authenticated Encryption/Decryption with AES CCM Authenticated Encryption/Decryption with AES GCM
HMAC Key	HMAC key for Message Authentication Generation	112-524288 bits - 112-256 bits	Authentication key - CSP			Message Authentication Generation with HMAC
Entropy Input	(IG D.L) Entropy input used to seed the DRBGs	256 bits - 256 bits	Entropy - CSP			Random Number Generation with DRBG
DRBG Seed	(IG D.L) DRBG seed derived from entropy input as defined in SP 800-90Ar1	256 bits - 256 bits	DRBG seed - CSP	Random Number Generation with DRBG		Random Number Generation with DRBG
DRBG Internal State (V, Key)	(IG D.L) Internal state of CTR_DRBG	V: 128 bits, Key: 256 bits - 256 bits	Internal state - CSP	Random Number Generation with DRBG		Random Number Generation with DRBG
RSA Public Key	RSA public key used for RSA key	1024, 2048, 3072,	Public key - PSP	Key Generatio		Signature Verification with RSA

Name	Description	Size - Strength	Type - Category	Generated By	Established By	Used By
	generation, signature verification	4096 bits - 80-150 bits		n with RSA		
RSA Private Key	RSA private key used for RSA key generation, signature generation	2048, 3072, 4096 bits - 112-150 bits	Private key - CSP	Key Generation with RSA		Signature Generation with RSA
EC Public Key	EC public key used for EC key generation, key verification, signature verification, shared secret computation	P-224, P-256, P-384, P-521 - 112-256 bits	Public key - PSP	Key Generation with ECDSA		KAS-ECC-SSC (Shared Secret Computation with EC Diffie-Hellman) Signature Verification with ECDSA Key Verification with ECDSA
EC Private Key	EC private key used for EC key generation, key verification, signature generation, shared secret computation	P-224, P-256, P-384, P-521 - 112-256 bits	Private key - CSP	Key Generation with ECDSA		KAS-ECC-SSC (Shared Secret Computation with EC Diffie-Hellman) Signature Generation with ECDSA
ML-KEM Public Key	ML-KEM public key used for ML-KEM key generation, ML-KEM Key Encapsulation	800, 1184, 1568 bytes - 128-256 bits	Public key - PSP	Key Generation with ML-KEM		Encapsulation/Decapsulation with ML-KEM
ML-KEM Private Key	ML-KEM private key used for ML-KEM key generation, ML-KEM Key Decapsulation	1632, 2400, 3168 bytes - 128-256 bits	Private key - CSP	Key Generation with ML-KEM		Encapsulation/Decapsulation with ML-KEM

Name	Description	Size - Strength	Type - Category	Generated By	Established By	Used By
EDDSA Private Key	EDDSA private key used for EDDSA key generation, signature generation	256 bits - 128 bits	Private key - CSP	Key Generation with EDDSA		Signature Generation with EDDSA
EDDSA Public Key	EDDSA public key used for EDDSA key generation, signature verification	256 bits - 128 bits	Public key - PSP	Key Generation with EDDSA		Signature Verification with EDDSA
Shared Secret	Shared secret established with KAS-SSC and passed back to the calling application	P-224, P-256, P-384, P-521 - 112-256 bits	Shared secret - CSP	KAS-ECC-SSC (Shared Secret Computation with EC Diffie-Hellman)		Key Derivation with TLS KDF Key Derivation with SSH KDF Key Derivation with KDA HKDF
ML-KEM Shared Secret	Shared secret established with ML-KEM	32 bytes - 128-256 bits	Shared secret - CSP		Encapsulation/Decapsulation with ML-KEM	
TLS Pre-Master Secret	TLS Pre-Master secret used for deriving the TLS Master Secret	P-224, P-256, P-384, P-521 - 112-256 bits	TLS pre-master secret - CSP			Key Derivation with TLS KDF Key Derivation with KDA HKDF
TLS Master Secret	TLS Master secret used for deriving the TLS Derived Key	384 bits - 112-256 bits	TLS master secret - CSP	Key Derivation with TLS KDF Key Derivation with KDA HKDF		Key Derivation with TLS KDF Key Derivation with KDA HKDF
TLS Derived Key (AES/HMAC)	TLS Derived Key from TLS Master Secret	AES: 128-256 bits HMAC: 112 to 256 bits - AES: 128-256 bits HMAC: 112 to 256 bits	Symmetric key - CSP	Key Derivation with TLS KDF		

Name	Description	Size - Strength	Type - Category	Generated By	Established By	Used By
HKDF Derived Key	KDA HKDF derived key	2048 bits - 112-256 bits	Symmetric key - CSP	Key Derivation with KDA HKDF		
SSH Derived Key	SSH KDF derived key	128 to 512 bits - 112 to 256 bits	Symmetric key - CSP	Key Derivation with SSH KDF		
PBKDF Derived Key	PBKDF derived key	128 to 4096 bits - N/A	Symmetric key - CSP	Key Derivation with PBKDF		
KBKDF Derived Key	KBKDF derived key	2048 bits - 112-256 bits	Symmetric key - CSP	Key Derivation with KBKDF		
Password	Password for PBKDF	14-128 characters - N/A	Password - CSP			Key Derivation with PBKDF
Key Derivation Key	Key derivation key	112-524288 bits - 112-256 bits	Symmetric key - CSP			Key Derivation with KBKDF
KDA OneStep Derived Key	KDA OneStep derived key	2048 bits - 112-256 bits	Symmetric key - CSP	Key Derivation with KDA OneStep		
Intermediate Key Generation Value	Intermediate key generation value	224-4096 bits - 112-256 bits	Intermediate value - CSP	Key Generation with RSA Key Generation with ECDSA		Key Generation with RSA Key Generation with ECDSA

Table 18: SSP Table 2

9.5 Transitions

The SHA-1 algorithm as implemented by the module will be non-approved for all purposes, starting January 1, 2031.

The FIPS 186-4, has been superseded by FIPS 186-5. FIPS 186-4 was withdrawn on February 3, 2024. The details regarding usage of Legacy algorithms are specified in Section 2.7.

10 Self-Tests

10.1 Pre-Operational Self-Tests

Algorithm or Test	Test Properties	Test Method	Test Type	Indicator	Details
HMAC-SHA2-256 (A6176)	SHA2-256	Message Authentication	SW/FW Integrity	Module becomes operational	Integrity test for bcm.o
HMAC-SHA2-256 (A6177)	SHA2-256	Message Authentication	SW/FW Integrity	Module becomes operational	Integrity test for bcm.o
HMAC-SHA2-256 (A6178)	SHA2-256	Message Authentication	SW/FW Integrity	Module becomes operational	Integrity test for bcm.o
HMAC-SHA2-256 (A6179)	SHA2-256	Message Authentication	SW/FW Integrity	Module becomes operational	Integrity test for bcm.o
HMAC-SHA2-256 (A6180)	SHA2-256	Message Authentication	SW/FW Integrity	Module becomes operational	Integrity test for bcm.o
HMAC-SHA2-256 (A6184)	SHA2-256	Message Authentication	SW/FW Integrity	Module becomes operational	Integrity test for bcm.o
HMAC-SHA2-256 (A6278)	SHA2-256	Message Authentication	SW/FW Integrity	Module becomes operational	Integrity test for bcm.o
HMAC-SHA2-256 (A6279)	SHA2-256	Message Authentication	SW/FW Integrity	Module becomes operational	Integrity test for bcm.o

Table 19: Pre-Operational Self-Tests

The module performs the pre-operational self-test automatically when the module is loaded into memory; the pre-operational self-test is the software integrity test that ensures that the module is not corrupted. While the module is executing the pre-operational self-test, services are not available, and input and output are inhibited.

The software integrity test is performed after a set of conditional cryptographic algorithm self-tests (CASTs). The set of CASTs executed before the software integrity test consists of HMAC-SHA2-256 KAT, which is used in the pre-operational self-test, and the SHA2-256 KAT.

10.2 Conditional Self-Tests

Algorithm or Test	Test Properties	Test Method	Test Type	Indicator	Details	Conditions
AES-CBC-Encrypt (A6160)	Encrypt with 128-bit key	KAT	CAST	Module becomes operational	Symmetric operation	Module power-on
AES-CBC-Decrypt (A6160)	Decrypt with 128-bit key	KAT	CAST	Module becomes operational	Symmetric operation	Module power-on
AES-CBC-Encrypt (A6165)	Encrypt with 128-bit key	KAT	CAST	Module becomes operational	Symmetric operation	Module power-on
AES-CBC-Decrypt (A6165)	Decrypt with 128-bit key	KAT	CAST	Module becomes operational	Symmetric operation	Module power-on

Algorithm or Test	Test Properties	Test Method	Test Type	Indicator	Details	Conditions
AES-CBC-Encrypt (A6170)	Encrypt with 128-bit key	KAT	CAST	Module becomes operational	Symmetric operation	Module power-on
AES-CBC-Decrypt (A6170)	Decrypt with 128-bit key	KAT	CAST	Module becomes operational	Symmetric operation	Module power-on
AES-CBC-Encrypt (A6181)	Encrypt with 128-bit key	KAT	CAST	Module becomes operational	Symmetric operation	Module power-on
AES-CBC-Decrypt (A6181)	Decrypt with 128-bit key	KAT	CAST	Module becomes operational	Symmetric operation	Module power-on
AES-CBC-Encrypt (A6273)	Encrypt with 128-bit key	KAT	CAST	Module becomes operational	Symmetric operation	Module power-on
AES-CBC-Decrypt (A6273)	Decrypt with 128-bit key	KAT	CAST	Module becomes operational	Symmetric operation	Module power-on
AES-CBC-Encrypt (A6276)	Encrypt with 128-bit key	KAT	CAST	Module becomes operational	Symmetric operation	Module power-on
AES-CBC-Decrypt (A6276)	Decrypt with 128-bit key	KAT	CAST	Module becomes operational	Symmetric operation	Module power-on
AES-GCM-Encrypt (A6274)	Encrypt with 128-bit key, 96-bit (internal IV)	KAT	CAST	Module becomes operational	Symmetric operation	Module power-on
AES-GCM-Decrypt (A6274)	Decrypt with 128-bit key, 96-bit (internal IV)	KAT	CAST	Module becomes operational	Symmetric operation	Module power-on
AES-GCM-Encrypt (A6275)	Encrypt with 128-bit key, 96-bit (internal IV)	KAT	CAST	Module becomes operational	Symmetric operation	Module power-on
AES-GCM-Decrypt (A6275)	Decrypt with 128-bit key, 96-bit (internal IV)	KAT	CAST	Module becomes operational	Symmetric operation	Module power-on
AES-GCM-Encrypt (A6277)	Encrypt with 128-bit key, 96-bit (internal IV)	KAT	CAST	Module becomes operational	Symmetric operation	Module power-on
AES-GCM-Decrypt (A6277)	Decrypt with 128-bit key, 96-bit (internal IV)	KAT	CAST	Module becomes operational	Symmetric operation	Module power-on
AES-GCM-Encrypt (A6161)	Encrypt with 128-bit key, 96-bit (internal IV)	KAT	CAST	Module becomes operational	Symmetric operation	Module power-on
AES-GCM-Decrypt (A6161)	Decrypt with 128-bit key, 96-bit (internal IV)	KAT	CAST	Module becomes operational	Symmetric operation	Module power-on
AES-GCM-Encrypt (A6162)	Encrypt with 128-bit key, 96-bit (internal IV)	KAT	CAST	Module becomes operational	Symmetric operation	Module power-on

Algorithm or Test	Test Properties	Test Method	Test Type	Indicator	Details	Conditions
AES-GCM-Decrypt (A6162)	Decrypt with 128-bit key, 96-bit (internal IV)	KAT	CAST	Module becomes operational	Symmetric operation	Module power-on
AES-GCM-Encrypt (A6163)	Encrypt with 128-bit key, 96-bit (internal IV)	KAT	CAST	Module becomes operational	Symmetric operation	Module power-on
AES-GCM-Decrypt (A6163)	Decrypt with 128-bit key, 96-bit (internal IV)	KAT	CAST	Module becomes operational	Symmetric operation	Module power-on

Table 20: Conditional Self-Tests

Conditional Cryptographic Algorithm Tests

The module performs self-tests on approved cryptographic algorithms, using the tests shown in the *Conditional Self-Tests* table. Data output through the data output interface is inhibited during the self-tests. The CASTs are performed in the form of Known Answer Tests (KATs), in which the calculated output is compared with the expected known answer (that are hard-coded in the module). A failed match causes a failure of the self-test. If any of these self-tests fails, the module transitions to error state.

Conditional Pair-Wise Consistency Tests

The module implements RSA, ECDSA, EDDSA key generation services and performs the respective pairwise consistency test (PCT) using sign and verify functions. Additionally, the module performs ML-KEM key generation service and performs the PCT using encapsulation and decapsulation. The PCTs are listed in the *Conditional Self-Tests* table. If any of these self-tests fails, the module transitions to error state and is aborted.

10.3 Periodic Self-Test Information

Algorithm or Test	Test Method	Test Type	Period	Periodic Method
HMAC-SHA2-256 (A6176)	Message Authentication	SW/FW Integrity	On demand	Manually
HMAC-SHA2-256 (A6177)	Message Authentication	SW/FW Integrity	On demand	Manually

Table 22: Conditional Periodic Information

10.4 Error States

Name	Description	Conditions	Recovery Method	Indicator
Error	The library is aborted with SIGABRT signal. Module is no longer operational the data output interface is inhibited	Pre-operational test failure; CAST failure; PCT failure	Module reset	Per-operational test failure: Error message is output (i.e., "FIPS integrity test failed.") on the stderr and then the module is aborted; Conditional test failure: For CAST failure, an error message indicating which KAT failed (e.g., "* KAT failed") is output on the stderr and then the module is aborted. Upon PCT or entropy source failure the module enters the error state (i.e., is aborted). The abort statement indicates that the module has been aborted.

Table 23: Error States

If the module fails any of the self-tests, the module enters an error state. To recover from any error state, the module must be rebooted.

10.5 Operator Initiation of Self-Tests

The software integrity tests and the CASTs for HMAC, SHA, AES, DRBG, TLS KDF, PBKDF2, KDA OneStep, KBKDF, KDA HKDF, can be invoked by unloading and subsequently re-initializing the module. The CASTs for ECDSA, EDDSA, RSA can be invoked by requesting the corresponding Key Generation, Digital Signature Generation, Digital Signature Verification services. The CAST for KAS-ECC-SSC can be invoked by requesting the Shared Secret Computation service. The CASTs for ML-KEM can be invoked by the corresponding Key Generation, Encapsulation and Decapsulation services. Additionally, all the CASTs can be invoked by calling the BORINGSSL_self_test function. The PCTs can be invoked on demand by requesting the Key Generation service.

11 Life-Cycle Assurance

11.1 Installation, Initialization, and Startup Procedures

The module bcm.o is embedded into the usersapce application which can be obtained by building the source code at the following location [1]. The set of files specified in the archive constitutes the complete set of source files of the validated module. There shall be no additions, deletions, or alterations of this set as used during module build.

[1] https://github.com/aws/aws-lc/archive/refs/tags/AWS-LC-FIPS-3.1.0.zip

The downloaded zip file can be verified by issuing the “sha256sum AWS-LC-FIPS-3.1.0.zip” command. The expected SHA2-256 digest value is:

fe408fa438850786396faf79eba9ea4116c3802e60f3a95865f0dd2adb64c9f1

After the zip file is extracted, the instructions listed below will compile the module. The compilation instructions must be executed separately on platforms that have different processors and/or operating systems. Due to two possible combinations of OS/processor, the module count is two (i.e., there are two separate binaries generated, one for each entry listed in the *Tested Operational Environments* table).

Amazon Linux 2023:

1. `sudo yum groupinstall "Development Tools"`
2. `sudo yum install cmake3 golang`
3. `cd aws-lc-AWS-LC-FIPS-3.1.0`
4. `mkdir build`
5. `cd build`
6. `cmake3 -DFIPS=1 -DBUILD_SHARED_LIBS=1 ..`
7. `make`

Upon completion of the build process, the module’s status can be verified by the command below. If the value obtained is “1” then the module has been installed and configured to operate in FIPS compliant manner.

```
./tool/bssl isfips
```

Lastly, the user can call the “show version” service using awslc_version_string function and the expected output is “AWS-LC FIPS 3.1.0” which is the module version. This will confirm that the module is in the operational mode. Additionally, the “AWS-LC FIPS” also acts as the module identifier and the verification of the "dynamic" part can be done using following command with an application that was used for dynamic linking. The "U" in the output confirms that the module is dynamically linked.

Command: *nm <application_name> | grep awslc_version_string*

Example Output: *“ **U** awslc_version_string”*

If the module is not installed following the instructions specified above, the “`./tool/bssl isfips`” command will output “0”, the module will be in a non-compliant state and not considered a validated module in that state.

11.2 Administrator Guidance

The Approved and non-Approved modes of operation are specified in section 2.4. The administrative functions are specified in the Approved Services table. All the logical interfaces are specified in section 3.1. The requirements and restrictions that shall be considered when operating the module in approved mode are specified in section 2.7 and section 6. The installation, initialization, and startup procedures specified in section 11.1 shall be followed.

When the module is at end of life, for the GitHub repo, the README will be modified to mark the library as deprecated. After a 6-month window, more restrictive branch permissions will be added such that only administrators can read from the FIPS branch.

The module does not possess persistent storage of SSPs. The SSP value only exists in volatile memory and that value vanishes when the module is powered off. So as a first step for the secure sanitization, the module needs to be powered off. Then for actual deprecation, the module will be upgraded to newer version that is approved. This upgrade process will uninstall/remove the old/terminated module and provide a new replacement.

12 Mitigation of Other Attacks

12.1 Attack List

RSA timing attacks.

12.2 Mitigation Effectiveness

RSA is vulnerable to timing attacks. In a setup where attackers can measure the time of RSA decryption or signature operations, blinding must be used to protect the RSA operation from that attack.

The module provides the mechanism to use the blinding for RSA. When the blinding is on, the module generates a random value to form a blinding factor in the RSA key before the RSA key is used in the RSA cryptographic operations.
