# 1 General

## 1.1 Overview

This document is a non-proprietary FIPS 140-3 Security Policy for the Samsung Kernel Cryptographic Module. It contains the security rules under which the module must operate and describes how this module meets the requirements as specified in FIPS PUB 140-3 (Federal Information Processing Standards Publication 140-3) for an overall Security Level 1 module.

## 1.2 Security Levels

| Section | Title                                   | Security Level |
|---------|-----------------------------------------|----------------|
| 1       | General                                 | 1              |
| 2       | Cryptographic module specification      | 1              |
| 3       | Cryptographic module interfaces         | 1              |
| 4       | Roles, services, and authentication     | 1              |
| 5       | Software/Firmware security              | 1              |
| 6       | Operational environment                 | 1              |
| 7       | Physical security                       | N/A            |
| 8       | Non-invasive security                   | N/A            |
| 9       | Sensitive security parameter management | 1              |
| 10      | Self-tests                              | 1              |
| 11      | Life-cycle assurance                    | 1              |
| 12      | Mitigation of other attacks             | N/A            |
|         | Overall Level                           | 1              |

Table 1: Security Levels

# 2 Cryptographic Module Specification

## 2.1 Description

### Purpose and Use:

The Samsung Kernel Cryptographic Module (hereafter referred to as “the module” or SKC) is a software module running on a multi-chip standalone general-purpose computing platform. The module’s software version number is 2.3. The module provides cryptographic services to Kernel through an application program interface (API). The binary image that contains the Samsung Kernel Cryptographic Module for the appropriate platform is boot.img.

**Module Type:** Software

**Module Embodiment:** Multi-Chip Standalone

**Module Characteristics:**

**Cryptographic Boundary:**

The module is defined as a multi-chip standalone software module, with the boundary of the Tested Operational Environment's Physical Perimeter (TOEPP) being defined as the physical perimeter of the tested platform enclosure around which everything runs. Figure 1 below illustrates a block diagram of a typical GPC and the module's physical perimeter. The module's cryptographic boundary consists of all functionalities contained within the module's compiled source code and comprises the following object files components. The object files are generated from the sources through the kernel build process. The module is intended only for single-process execution.

| #  | Object file name     |
|----|----------------------|
| 1  | fips140_integrity.o  |
| 2  | fips140_post.o       |
| 3  | fips140_test.o       |
| 4  | fips140_out.o        |
| 5  | fips140_3_services.o |
| 6  | api.o                |
| 7  | cipher.o             |
| 8  | algapi.o             |
| 9  | scatterwalk.o        |
| 10 | skcipher.o           |
| 11 | ahash.o              |
| 12 | shash.o              |
| 13 | hmac.o               |
| 14 | sha1_generic.o       |
| 15 | sha256_generic.o     |
| 16 | sha512_generic.o     |
| 17 | ecb.o                |
| 18 | cbc.o                |
| 19 | aes_generic.o        |
| 20 | aes-ce-core.o        |
| 21 | aes-ce-glue.o        |
| 22 | aes-ce.o             |
| 23 | aes-glue-ce.o        |
| 24 | sha256-core.o        |
| 25 | sha256-glue.o        |
| 26 | sha2-ce-core.o       |
| 27 | sha2-ce-glue.o       |
| 28 | sha1-ce-core.o       |
| 29 | sha1-ce-glue.o       |

### **Tested Operational Environment's Physical Perimeter (TOEPP):**

The boundary of the TOEPP is defined as the entire chassis unit's physical perimeter encompassing the "top," "front," "left," "right," "rear" and "bottom" surfaces of the case, and shown in the figures below.

Figure 1: Block Diagram

## 2.2 Tested and Vendor Affirmed Module Version and Identification

### Tested Module Identification – Hardware:

N/A for this module.

### Tested Module Identification – Software, Firmware, Hybrid (Executable Code Sets):

| Package or File Name | Software/ Firmware Version | Features | Integrity Test |
|----------------------|----------------------------|----------|----------------|
| boot.img             | 2.3                        |          | HMAC-SHA2-256  |

Table 2: Tested Module Identification – Software, Firmware, Hybrid (Executable Code Sets)

### Tested Module Identification – Hybrid Disjoint Hardware:

N/A for this module.

### Tested Operational Environments - Software, Firmware, Hybrid:

| Operating System  | Hardware Platform   | Processors                      | PAA/PAI | Hypervisor or Host OS | Version(s) |
|-------------------|---------------------|---------------------------------|---------|-----------------------|------------|
| Linux Kernel 5.15 | Samsung Galaxy S23  | Snapdragon 8 Gen 2              | Yes     |                       | 2.3        |
| Linux Kernel 5.15 | Samsung Galaxy S23  | Snapdragon 8 Gen 2              | No      |                       | 2.3        |
| Linux Kernel 5.15 | Samsung Tab Active5 | Samsung Electronics Exynos 1380 | Yes     |                       | 2.3        |

| Operating System  | Hardware Platform        | Processors                      | PAA/PAI | Hypervisor or Host OS | Version(s) |
|-------------------|--------------------------|---------------------------------|---------|-----------------------|------------|
| Linux Kernel 5.15 | Samsung Tab Active5      | Samsung Electronics Exynos 1380 | No      |                       | 2.3        |
| Linux Kernel 5.15 | Samsung Galaxy Tab S9 FE | Samsung Electronics Exynos 1380 | Yes     |                       | 2.3        |
| Linux Kernel 5.15 | Samsung Galaxy Tab S9 FE | Samsung Electronics Exynos 1380 | No      |                       | 2.3        |

Table 3: Tested Operational Environments - Software, Firmware, Hybrid

### Vendor-Affirmed Operational Environments - Software, Firmware, Hybrid:

| Operating System  | Hardware Platform                                             |
|-------------------|---------------------------------------------------------------|
| Linux Kernel 5.15 | Samsung Electronics Exynos 1380 running on Samsung Galaxy A35 |

Table 4: Vendor-Affirmed Operational Environments - Software, Firmware, Hybrid

CMVP makes no statement as to the correct operation of the module or the security strengths of the generated keys when so ported if the specific operational environment is not listed on the validation certificate.

## 2.3 Excluded Components

N/A for this module

## 2.4 Modes of Operation

### Modes List and Description:

| Mode Name         | Description                                                                                                                        | Type         | Status Indicator                                                               |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------|--------------|--------------------------------------------------------------------------------|
| Approved Mode     | Automatically entered whenever an approved service is requested. API function <code>skc_is_approved_service()</code> returns 1.    | Approved     | Equivalent to the indicator of the requested service as defined in section 4.3 |
| Non-Approved Mode | Automatically entered whenever a non-approved service is requested. API function <code>skc_is_approved_service()</code> returns 0. | Non-Approved | Equivalent to the indicator of the requested service as defined in section 4.4 |

Table 5: Modes List and Description

Module supports both approved and non-approved modes of operation. The module will be in approved mode when all pre-operational self-tests have completed successfully and only approved algorithms/services are invoked. Table 16 lists the approved services. The non-

approved mode is entered when a non-approved algorithm/non-approved service is invoked. Table 17 lists non-approved services. The Approved mode of operation can only be transitioned into the non-Approved mode by calling one of the non-Approved services listed in Table 17.

## 2.5 Algorithms

### Approved Algorithms:

| Algorithm     | CAVP Cert | Properties                                                      | Reference  |
|---------------|-----------|-----------------------------------------------------------------|------------|
| AES-CBC       | A3242     | Direction - Decrypt, Encrypt<br>Key Length - 128, 192, 256      | SP 800-38A |
| AES-ECB       | A3242     | Direction - Decrypt, Encrypt<br>Key Length - 128, 192, 256      | SP 800-38A |

Table 8: Security Function Implementations

## 2.7 Algorithm Specific Information

- SHA-1

Per SP800-131Ar2, the use of SHA-1 is disallowed for digital signature generation, but is permitted for digital signature verification (legacy use) and all non-digital signature applications. This implementation will be non-Approved for all uses starting January 1, 2031. User should move to SHA2, which is available in this module.

## 2.8 RBG and Entropy

N/A for this module.

N/A for this module.

## 2.9 Key Generation

## 2.10 Key Establishment

## 2.11 Industry Protocols

# 3 Cryptographic Module Interfaces

## 3.1 Ports and Interfaces

| Physical Port | Logical Interface(s) | Data That Passes                                 |
|---------------|----------------------|--------------------------------------------------|
| N/A           | Data Input           | API input parameters.                            |
| N/A           | Data Output          | API output parameters.                           |
| N/A           | Control Input        | API function calls, API control input parameters |
| N/A           | Control Output       | N/A                                              |
| N/A           | Status Output        | API return code, log messages.                   |

Table 9: Ports and Interfaces

The module's physical perimeter encompasses the case of the tested platform mentioned in Table 2. The module provides its logical interfaces via Application Programming Interface (API) calls. The logical interfaces provided by the module are mapped onto the FIPS 140-3 interfaces (data input, data output, control input, control output and status output) as shown above. The module's data output interface will be disabled when performing the self-test service, zeroization service, or when in an error state.

## 4 Roles, Services, and Authentication

### 4.1 Authentication Methods

N/A for this module.

The module supports Crypto Officer (CO) role. The cryptographic module does not provide any authentication methods. The module does not allow concurrent operators. The Crypto Officer is implicitly assumed based on the service requested.

### 4.2 Roles

| Name           | Type | Operator Type | Authentication Methods |
|----------------|------|---------------|------------------------|
| Crypto Officer | Role | CO            | None                   |

Table 10: Roles

### 4.3 Approved Services

| Name                | Description                                                                | Indicator | Inputs                                  | Outputs                                | Security Functions | SSP Accesses         |
|---------------------|----------------------------------------------------------------------------|-----------|-----------------------------------------|----------------------------------------|--------------------|----------------------|
| Show status         | Provide Module's current status (status message)                           | N/A       | Command used to show Module's Status    | Module's operational status            | None               | Crypto Officer       |
| Show version        | Provide Module's name and version information                              | N/A       | Command to show Module's ID and version | Module's ID and versioning information | None               | Crypto Officer       |
| Perform Self-Tests  | Perform Self-Tests (Pre-operational self-tests and Conditional Self-Tests) | N/A       | Command to trigger self-tests           | Status of the self-tests results       | None               | Crypto Officer       |
| Perform Zeroization | Perform Zeroization                                                        | N/A       | Command to zeroize                      | Status of the SSPs                     | None               | Crypto Officer - AES |

| Name                      | Description                          | Indicator                                   | Inputs                                  | Outputs               | Security Functions | SSP Accesses                      |
|---------------------------|--------------------------------------|---------------------------------------------|-----------------------------------------|-----------------------|--------------------|-----------------------------------|
|                           |                                      |                                             | the module                              | zeroization           |                    | Key: Z<br>- HMAC<br>Key: Z        |
| Module initialization     | Initialize the module                | N/A                                         | Command to initialize the module        | Initialization status | None               | Crypto Officer                    |
| Symmetric encryption      | Encrypt a plaintext                  | API function get_service_status() returns 1 | Key, cipher text, initialization vector | Cipher text           | AES encryption     | Crypto Officer - AES<br>Key: W,E  |
| Symmetric decryption      | Decrypt a cipher text                | API function get_service_status() returns 1 | Key, cipher text, initialization vector | Plain text            | AES decryption     | Crypto Officer - AES<br>Key: W,E  |
| Message digest generation | Generate message digest              | API function get_service_status() returns 1 | Message                                 | Message digest        | Hash generation    | Crypto Officer                    |
| MAC generation            | Generate message authentication code | API function get_service_status() returns 1 | Message, key                            | MAC                   | HMAC generation    | Crypto Officer - HMAC<br>Key: W,E |

Table 11: Approved Services

#### 4.4 Non-Approved Services

| Name                                                 | Description                                                                                                          | Algorithms               | Role           |
|------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|--------------------------|----------------|
| MAC generation                                       | Generate message authentication code. API function get_service_status() returns 0                                    | CMAC                     | Crypto Officer |
| Symmetric encryption/decryption                      | Non-approved encryption/decryption algorithm. API function get_service_status() returns 0                            | ESSIV-CBC-AES<br>AES-CTR | Crypto Officer |
| Symmetric encryption/decryption with block stealing. | Non-approved symmetric, block stealing, encryption/decryption algorithm. API function get_service_status() returns 0 | ESSIV-CBC-AES<br>AES-XTS | Crypto Officer |

Table 12: Non-Approved Services

## 4.5 External Software/Firmware Loaded

N/A for this module

## 4.6 Additional Information

The module supports unauthenticated service. The unauthenticated operator can trigger the self-test service by power-cycling the module.

# 5 Software/Firmware Security

## 5.1 Integrity Techniques

The module is provided in the form of binary executable code. To ensure the software security, the module is protected by HMAC-SHA2-256 (HMAC Certs. #A3242) algorithm. The software integrity test key (non-SSP) was preloaded to the module's binary in the factory and used for software integrity test only at the pre-operational self-test. At Module's initialization, the integrity of the runtime executable is verified using a HMAC-SHA2-256 digest which is compared to a value computed at build time. If at load time the MAC does not match the stored, known MAC value, the module would enter to an Error state with all crypto functionality inhibited.

## 5.2 Initiate on Demand

The integrity test is performed as part of the pre-operational self-tests. It is automatically executed at power-on. The operator can initiate the integrity test on demand by power cycling the host platform.

# 6 Operational Environment

## 6.1 Operational Environment Type and Requirements

**Type of Operational Environment:** Modifiable

The module operates in a modifiable operational environment per FIPS 140-3 level 1 specifications. The module runs within a commercially available kernel of the general-purpose operating system. The module is executing on the hardware specified in the Table 2.

The operating is restricted to a single operator. Only a single instance of the module is allowed in the Operational environment. The operating environment is non-configurable for the operator. The operational environment provides the capability to separate the module during operation from other functions in the operational environment. Those functions do not obtain information from the module related to the CSPs and do not modify CSPs, PSPs, or the execution flow of the module other than via the interfaces provided by the module itself.

The module does not spawn any processes.

## 7 Physical Security

N/A for this module.

## 8 Non-Invasive Security

N/A for this module.

## 9 Sensitive Security Parameters Management

### 9.1 Storage Areas

| Storage Area Name                       | Description                                                                             | Persistence Type |
|-----------------------------------------|-----------------------------------------------------------------------------------------|------------------|
| Tested Platform's RAM (Volatile memory) | Temporary storage within TOEPP for SSPs used by the module as part of service execution | Dynamic          |

Table 13: Storage Areas

The module does not provide persistent storage for keys or SSPs. The module uses pointers to plaintext keys/SSPs that are passed in by the calling application. The module does not store any SSP beyond the lifetime of an API call. Allocated memory in RAM for SSP is managed by the module.

### 9.2 SSP Input-Output Methods

| Name           | From                        | To     | Format Type | Distribution Type | Entry Type | SFI or Algorithm |
|----------------|-----------------------------|--------|-------------|-------------------|------------|------------------|
| SSPs API input | Calling application (TOEPP) | Module | Plaintext   | Manual            | Electronic |                  |

Table 14: SSP Input-Output Methods

### 9.3 SSP Zeroization Methods

| Zeroization Method   | Description                                                                                     | Rationale                                                          | Operator Initiation                                          |
|----------------------|-------------------------------------------------------------------------------------------------|--------------------------------------------------------------------|--------------------------------------------------------------|
| Zeroization API call | Zeroization command calling context destructor to zeroize all SSPs stored in its context struct | SSPs are actively overwritten with zeroes and thus not recoverable | Using <code>crypto_free_&lt;transformation type&gt;()</code> |
| Power down           | Power down the tested platform to zeroize all SSPs                                              | SSPs stored in the tested platform's volatile memory will          | Power down the tested platform                               |

| Zeroization Method | Description | Rationale                       | Operator Initiation |
|--------------------|-------------|---------------------------------|---------------------|
|                    |             | be zeroized after power is lost |                     |

Table 15: SSP Zeroization Methods

## 9.4 SSPs

| Name     | Description                               | Size - Strength                       | Type - Category         | Generated By | Established By | Used By                          |
|----------|-------------------------------------------|---------------------------------------|-------------------------|--------------|----------------|----------------------------------|
| AES Key  | Keys used for AES encryption / decryption | 128, 192, 256 bits - 128 to 256 bits  | Symmetric AES key - CSP |              |                | AES encryption<br>AES decryption |
| HMAC Key | Keyed Hash                                | at least 160 bits - at least 112 bits | MAC key - CSP           |              |                | HMAC generation                  |

Table 16: SSP Table 1

| Name     | Input - Output | Storage                                            | Storage Duration                 | Zeroization                        | Related SSPs |
|----------|----------------|----------------------------------------------------|----------------------------------|------------------------------------|--------------|
| AES Key  | SSPs API input | Tested Platform's RAM (Volatile memory): Plaintext | For the lifetime of the API call | Zeroization API call<br>Power down |              |
| HMAC Key | SSPs API input | Tested Platform's RAM (Volatile memory): Plaintext | For the lifetime of the API call | Zeroization API call<br>Power down |              |

Table 17: SSP Table 2

The cryptographic module is passed a pointer to the cryptographic keys as API parameters, associated by memory location. The application calling the cryptographic module passes keys in plaintext within the physical perimeter. The module does not perform storage of keys. All SSPs can be zeroized by power cycling the host.

## 10 Self-Tests

### 10.1 Pre-Operational Self-Tests

| Algorithm or Test     | Test Properties | Test Method | Test Type       | Indicator                                             | Details       |
|-----------------------|-----------------|-------------|-----------------|-------------------------------------------------------|---------------|
| HMAC-SHA2-256 (A3242) | HMAC-SHA2-256   | KAT         | SW/FW Integrity | When the test passes, do_integrity_check() returns 0, | HMAC-SHA2-256 |

| Algorithm or Test | Test Properties | Test Method | Test Type | Indicator                                                 | Details |
|-------------------|-----------------|-------------|-----------|-----------------------------------------------------------|---------|
|                   |                 |             |           | otherwise it returns -1 and device gets into error state. |         |

Table 18: Pre-Operational Self-Tests

The module performs Pre-operational Self-tests automatically when the module is loaded into memory (i.e. at power on). The Pre-operational Self-tests contain pre-operational software integrity test to ensure that the module is not corrupted. The integrity test is performed on the runtime image of the module using HMAC-SHA2-256. Prior to software integrity test, a CAST for HMAC-SHA2-256 is performed. If the CAST on the HMAC-SHA-256 is successful, the HMAC value of the runtime image is recalculated and compared with the stored HMAC value pre-computed at compilation time (for details, see also Section 5). While the module is performing the Pre-operational Self-tests no other functions are available and all output is inhibited. Once Pre-operational Self-tests are completed successfully, the module enters operational mode and cryptographic services are available.

## 10.2 Conditional Self-Tests

| Algorithm or Test           | Test Properties                 | Test Method | Test Type | Indicator                                                                                                | Details            | Conditions                                              |
|-----------------------------|---------------------------------|-------------|-----------|----------------------------------------------------------------------------------------------------------|--------------------|---------------------------------------------------------|
| AES-ECB Encrypt KAT (A3242) | Key lengths: 128, 192, 256 bits | KAT         | CAST      | When the test passes, fips140_kat() returns 0, otherwise it returns -1 and device gets into error state. | AES-ECB encryption | During the module start-up or using fips140_kat()       |
| AES-ECB Decrypt KAT (A3242) | Key lengths: 128, 192, 256 bits | KAT         | CAST      | When the test passes, fips140_kat() returns 0, otherwise it returns -1 and device gets into error state. | AES-ECB decryption | During the module start-up or using fips140_kat()       |
| SHA-1 KAT (A5143)           | N/A                             | KAT         | CAST      | When the test passes, fips140_kat() returns 0, otherwise it returns -1 and device gets into error state. | Hash generation    | During module start-up or on-demand using fips140_kat() |
| SHA2-224 KAT (A5143)        | N/A                             | KAT         | CAST      | When the test passes, fips140_kat() returns 0,                                                           | Hash generation    | During module start-up or on-demand using fips140_kat() |

| HMAC-SHA2-384 KAT (A3242) | SHA2-384        | KAT         | CAST      | When the test passes, fips140_kat() returns 0, otherwise it returns -1 and device gets into error state. | HMAC generation | During module start-up or on-demand using fips140_kat() |
| HMAC-SHA2-512 KAT (A3242) | SHA2-512        | KAT         | CAST      | When the test passes, fips140_kat() returns 0, otherwise it returns -1 and device gets into error state. | HMAC generation | During module start-up or on-demand using fips140_kat() |

Table 19: Conditional Self-Tests

The module performs on-demand self-tests initiated by the operator, by powering off and powering the module back on. The full suite of self-tests is then executed. The same procedure may be employed by the operator to perform periodic self-tests.

### 10.3 Periodic Self-Test Information

| Algorithm or Test     | Test Method | Test Type       | Period    | Periodic Method                                 |
|-----------------------|-------------|-----------------|-----------|-------------------------------------------------|
| HMAC-SHA2-256 (A3242) | KAT         | SW/FW Integrity | On demand | Reload the module or use fips140_kat() API call |

Table 20: Pre-Operational Periodic Information

| Algorithm or Test           | Test Method | Test Type | Period    | Periodic Method                                 |
|-----------------------------|-------------|-----------|-----------|-------------------------------------------------|
| AES-ECB Encrypt KAT (A3242) | KAT         | CAST      | On demand | Reload the module or use fips140_kat() API call |
| AES-ECB Decrypt KAT (A3242) | KAT         | CAST      | On demand | Reload the module or use fips140_kat() API call |

| Algorithm or Test         | Test Method | Test Type | Period    | Periodic Method                                 |
|---------------------------|-------------|-----------|-----------|-------------------------------------------------|
| SHA-1 KAT (A5143)         | KAT         | CAST      | On demand | Reload the module or use fips140_kat() API call |
| SHA2-224 KAT (A5143)      | KAT         | CAST      | On demand | Reload the module or use fips140_kat() API call |
| SHA2-256 KAT (A5143)      | KAT         | CAST      | On demand | Reload the module or use fips140_kat() API call |
| SHA2-384 KAT (A5143)      | KAT         | CAST      | On demand | Reload the module or use fips140_kat() API call |
| SHA2-512 KAT (A5143)      | KAT         | CAST      | On demand | Reload the module or use fips140_kat() API call |
| HMAC-SHA-1 KAT (A3242)    | KAT         | CAST      | On demand | Reload the module or use fips140_kat() API call |
| HMAC-SHA2-224 KAT (A3242) | KAT         | CAST      | On demand | Reload the module or use fips140_kat() API call |
| HMAC-SHA2-256 KAT (A3242) | KAT         | CAST      | On demand | Reload the module or use fips140_kat() API call |
| HMAC-SHA2-384 KAT (A3242) | KAT         | CAST      | On demand | Reload the module or use fips140_kat() API call |
| HMAC-SHA2-512 KAT (A3242) | KAT         | CAST      | On demand | Reload the module or use fips140_kat() API call |

Table 21: Conditional Periodic Information

The module performs on-demand self-tests initiated by the operator (via calling fips140\_post() service), by power-cycling, or rebooting the tested platform. The pre-operational software integrity test and the full suite of self-tests listed in Table 12 are executed. The same procedure may be employed by the operator to perform periodic self-tests. If any of the tests fail, the module will enter error state.

## 10.4 Error States

| Name  | Description                   | Conditions                                                                                                            | Recovery Method   | Indicator                                                                      |
|-------|-------------------------------|-----------------------------------------------------------------------------------------------------------------------|-------------------|--------------------------------------------------------------------------------|
| Error | The module's only error state | Any failure in context of the execution of the implemented self-tests during module start-up or the self-test service | Reload the module | The OE's OS log contains message 'FIPS : POST - one or more selftests failed'. |

Table 22: Error States

The error state represents an unrecoverable error. The module will automatically reload the image. In the Error State, no cryptographic services are provided, and data output is prohibited.

The module has a variable (skc\_fips\_enabled) indicating the status of the Self-test. It contains 0 if the Self-test was failed and it contains 1 if the Self-test was successful.

The kernel logs contains message:

FIPS : POST - integrity test failed

in case of integrity test is failed,

FIPS : <alg name>, test failed, err=<test number>

## 11 Life-Cycle Assurance

### 11.1 Installation, Initialization, and Startup Procedures

This cryptographic module is built-in along with the Linux Kernel. The module is initialized during the Kernel boot-up before any cryptographic functionality is available. The Kernel is responsible for the initialization and loading processes of the module. The module is designed with module init entry point which ensures that the pre-operational self-tests and CASTs are initiated automatically when the module is loaded.

### 11.2 Administrator Guidance

N/A

### 11.3 Non-Administrator Guidance

N/A

## 12 Mitigation of Other Attacks

N/A for this module.
