# 127 **1 PP introduction**

## 128 **1.1 PP identification**

129 Title: Financial Smart Card Application Protection Profile  
130 TOE class: Financial Smart Card for the Taiwanese Market  
131 Document name: PP\_FISC\_V1.2  
132 Version: 1.2  
133 Document Date: 2005-11-11  
134 Author: BAROC/FISC Smart Card Group  
135 CC Version 2.1  
136 All final interpretations until September, 20<sup>th</sup> 2005 have been  
137 considered  
138 EAL: 4+ augmented by AVA\_VLA.4 and ADV\_IMP.2  
139 SOF-claim: high  
140 Certification ID: BSI-PP-0021  
141 Evaluation Body: TÜViT GmbH, Germany  
142 Certification Body: BSI, Germany  
143 Keywords: Smart card, TAC, BAROC, financial transaction, FISC, Taiwan  
144 Banking System, Common Criteria, Protection Profile

## 145 **1.2 PP overview**

146 Because of serious circumstances of counterfeiting and skimming, and because  
147 of the functional limitations of magnetic stripe cards, the Bankers Association of  
148 the Republic of China (BAROC) initiated the Chip Migration Task Force Team in  
149 Feb. 2001, to evaluate the feasibility of Chip Migration Project and to develop  
150 related specifications.

151 BAROC developed this Protection Profile to serve as a baseline for the security  
152 of smartcards developed by different vendors. These smartcards will be used for  
153 the financial transactions within the FISC inter-bank system.

154 This PP focuses on a Financial Smart Card which consists of embedded  
155 software and a secure IC Controller. The TOE is used as a security token for  
156 inter-bank financial transactions, such as cash withdrawal, fund transfer, tax  
157 payment and online sale.

158 The main objectives of this Protection Profile are:

- 159 • To describe the security environment of the TOE including assets to be  
160 protected and threats to be countered by the TOE and its environment.
- 161 • To describe the security objectives of the TOE and its supporting  
162 environment.
- 163 • To specify the security requirements, which include the TOE security  
164 functional requirements and the assurance requirements

165 **1.3 CC conformance claims**

166 This PP is claimed to be [CC] part 2 extended (FPT\_EMAN.1) and [CC] part 3  
167 conformant. This PP does not claim conformance to any other PP. The CC  
168 version used is: ISO/IEC 15408: Common Criteria, Version 2.1 All final  
169 interpretations until September, 20th 2005 have been considered.

170 The minimum strength level of the TOE security functions is SOF-high.

171 The assurance level is EAL4 augmented by AVA\_VLA.4 (highly resistant) and  
172 ADV\_IMP.2 (Implementation of the TSF).

173

174 **1.4 Acknowledgement**

175 The authors would like to highlight the significant impact of [SSCD] to the  
176 development of this Protection Profile. Due to the special requirements for the  
177 Taiwanese Financial Market it has unfortunately not been possible to directly use  
178 [SSCD]. Nevertheless many of the requirements for this PP and especially the  
179 extension of CC part II with FPT\_EMAN.1 have been taken from or inspired by  
180 the requirements in [SSCD].

181

## 182 2 TOE description

### 183 2.1 Overview

184 The TOE is a smart card which consists of embedded software and a secure IC  
185 Controller. The main purpose of the TOE is to act as a token in the FISC Inter-  
186 bank System (see Figure 2.1) where a cardholder can do financial transactions  
187 such as cash withdrawal, fund transfer, tax payment and purchase with it. The  
188 FISC Inter-bank System is a general-purpose platform for switching financial  
189 transactions between banks. The FISC Inter-bank System includes Issuer Bank,  
190 FISC, Acquire Bank and its Card Accepted Devices (CAD). The Issuer Bank is in  
191 charge of issuing cards to customers and authorizing online transactions from  
192 customers. FISC is in charge of switching, clearing and settlement of financial  
193 transactions. The Acquire Bank is in charge of Card Accepted Devices or so-  
194 called application channels and acquiring transactions from aforementioned  
195 application channels. The Issuer Bank and Acquire Bank shall be recognized by  
196 FISC.

197

198

**Figure 1: Inter-Bank-System**

199 Take fund transfer as an example; the transaction flow is as following:

- 200 1. A cardholder inserts its smartcard into the CAD and enters its PIN
- 201 2. The cardholder selects the "fund transfer" function.
- 202 3. The cardholder confirms the transaction. The CAD prepares transaction  
203 data characteristic for the type of transaction and sends it to the TOE via  
204 APDU command (following [ISO7816] part 4, augmented with TAC  
205 generation).
- 206 4. The TOE generates a serial number and a TAC in response to the CAD  
207 request.
- 208 5. The serial number and TAC are then transmitted to Issuer Bank via the  
209 FISC inter-bank system for transaction approval.
- 210 6. If the transaction is approved by Issuer Bank, the transaction amount is  
211 transferred.  
212

## 213 2.2 TOE Definition

214 The TOE is composed of a Smart Card IC and embedded software. Within the  
215 Taiwanese banking system aforementioned, the TOE is used to secure financial  
216 transactions.

217 Therefore, the TOE is able to generate a transaction authentication code (TAC)  
218 for a transaction record (also called DTBT = Data to be TAC'd) which is  
219 representing a kind of digital signature to secure the authenticity and integrity of  
220 the transaction.

221 Within this system, the major scope of the TOE is to protect the key which is  
222 used to generate a TAC.

## 223 2.3 TOE Boundaries

### 224 2.3.1 Physical Boundary

225 The TOE consists of a SmartCard with a physical interface compliant to ISO  
226 7816 part 2 with its dedicated software as well as the SmartCard embedded  
227 software and the related guidance documentation.

### 228 2.3.2 Logical Boundary

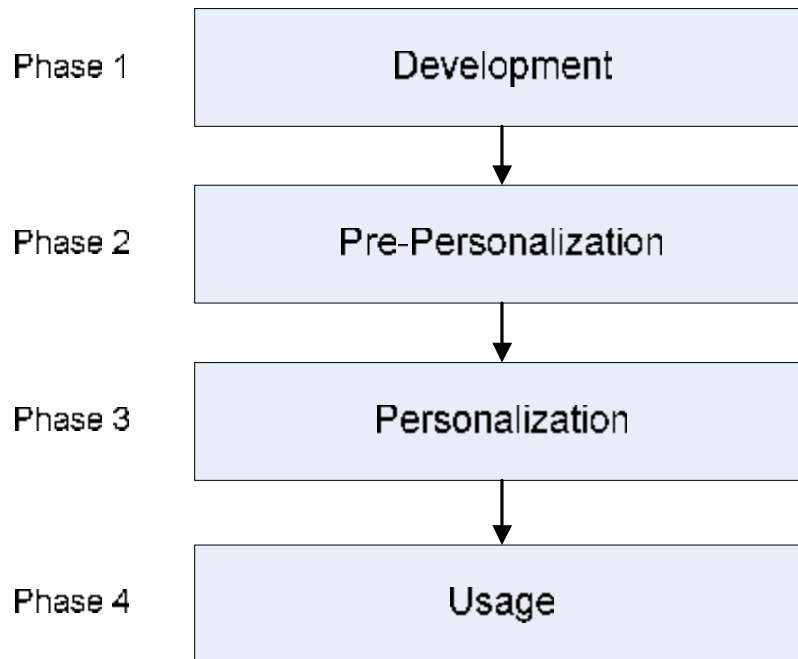

229 The TOE logical interface is represented by a set of APDU commands which is  
230 compliant to ISO 7816 part 4 (augmented with additional commands).

231 At its logical boundary, the TOE provides functions to generate a TAC for DTBT  
232 which can be sent to the TOE. The TOE provides no possibility to read out any  
233 cryptographic key but only to update the key which is used for TAC generation.

234 The TOE is acting as a kind of signature token which produces a TAC for every  
235 DTBT which is sent to the TOE. Before TAC generation, the user has to enter a  
236 PIN to confirm the TAC generation. However, disclosure of a confirmation PIN  
237 during entry by the CAD is not considered as a threat, and therefore, no trusted  
238 channels have to be provided by the TOE.

239 **2.4 TOE Life Cycle**

240 The TOE life cycle (LC) is shown in the following figure.

241

242 **Figure 2: Financial Smart Card Application life cycle**

243 The stages shown are listed below:

244 Phase 1: This phase covers the development and production process of the  
245 hardware and software the TOE is consisting of.

246 Phase 2: During the Pre-personalization process, the TOE is initialized. This is  
247 typically done at the site of card manufacturer. The delivery is done in a  
248 secure manner after this phase.

249 Phase 3: This phase includes provisioning all user data into the TOE which  
250 is necessary for the usage. This process is typically done at the site of  
251 issuing bank.

252 Phase 4: The cardholder can use the TOE to secure financial transactions via the  
253 FISC Inter-bank System.

254 **2.5 Roles**

255 The TOE maintains the following roles:

- 256 • Administrator An administrator is the only role which is allowed to use the  
257 key update functionality of the TOE provided during the  
258 phases 3 and 4.
- 259 • Cardholder A cardholder is a person who handles the TOE in usage  
260 phase. The person who holds the TOE is allowed to use it  
261 to generate a TAC in phase 4 (see TOE Life Cycle).

262 **2.6 Description of TOE security functionality**

263 The TOE security functionality consists of TAC generation, secure key update,  
264 and protection of TSF and user data.

265 2.6.1 TAC generation

266 The TOE calculates a TAC (Transaction Authentication Code) on transaction  
267 data. The TAC ensures authenticity and integrity of the transaction data. In  
268 addition to the TAC, the TOE also generates a transaction S/N (serial number)  
269 which participates in the calculation of the TAC. In order to generate a TAC, the  
270 user has to enter a PIN for confirmation.

271 2.6.2 Secure key update

272 The TOE is providing a secure means to update cryptographic keys (especially  
273 the key which is used for TAC generation) that will be stored in the TOE.

274 2.6.3 Protection of TSF and user data

275 The TOE protects its TSF and user data from unauthorized modification and  
276 disclosure.

277

## 278 **3 TOE security environment**

### 279 **3.1 Assets**

280 Assets are security relevant elements of the TOE. Generally speaking, the  
281 following groups of assets are available:

- 282 • Embedded software including specifications, implementation and related  
283 documentation
- 284 • Application data of the TOE (e.g. IC and software specific data,  
285 Initialisation data, Personalisation data)

#### 286 3.1.1 TAC Key

287 The TAC (Transaction Authentication Code) Key is a cryptographic key and is  
288 used by the “TAC Generation” within the TOE. The TAC key is stored in the  
289 EEPROM of the IC Controller during Phase 3. The TOE has to ensure the  
290 integrity and confidentiality of the TAC Key.

#### 291 3.1.2 Perso and Pre-perso Data

292 This data consists of user data and cryptographic keys.

#### 293 3.1.3 PIN

294 The PIN (Personal Identification Number) of the TOE is used to authenticate the  
295 user of the TOE. The PIN length shall be at least 6 digits and can be up to 12  
296 digits. The PIN is initially generated and stored in the EEPROM of IC controller  
297 by the administrator during Phase 3, and can be changed by Cardholder and  
298 Administrator during Phase 4. The TOE has to ensure the integrity and  
299 confidentiality of the PIN when stored on the card.

#### 300 3.1.4 Retry Counter

301 There is one retry counter stored in the EEPROM of IC Controller during Phase  
302 2-4. It is for accumulating consecutive failure attempts of Terminal  
303 Authentication and User Authentication. The status is blocked as the Retry  
304 Counter reaches the Retry Limit. The TOE has to ensure the integrity and  
305 confidentiality of the Retry Counter (Phase 2-4).

#### 306 3.1.5 Retry Limit

307 An upper bound of the Retry Counter stored in the EEPROM of IC Controller by  
308 Issuer Bank during Phase 3 to prohibit further attempts of authentication when  
309 the Retry Counter reaches its associated Retry Limit. The TOE has to ensure  
310 the integrity of the retry limit (Phase 2-3).

#### 311 3.1.6 Serial Number for transactions

312 A number which is incremented automatically by TOE after each transaction. It  
313 participates in TAC generation to ensure that the TAC calculation is not only  
314 based on DTBT but also based on the serial number.

315 3.1.7 DTBT (Data To Be TAC'd)

316 This is the data which is received by the TOE to generate a TAC over. In the  
 317 case of this TOE the DTBT is a transaction record which is used to secure a  
 318 financial transaction.

319 **3.2 Assumptions (about the environment)**

Assumption name	Description
<b>A.PERSO</b>	The Personalization and Pre-Personalization process is assumed to take place in an environment providing adequate physical security and performed by trustworthy personnel.  Any data which is handled during these processes must be kept confidential.  During key update, a secure CAD which is able to provide authentication and encryption has to be used.
<b>A.KEY</b>	All cryptographic keys which are created in the environment to be used within the TOE have to be created and handled in a secure manner and must have sufficient quality.
<b>A.DEVELOPMENT</b>	TOE development and test information during phases 1 and 2 is protected in a secure environment for its integrity and confidentiality. In case of delivery between different actors like IC manufacturer and embedded software developer, this information is also protected in the same manner as aforementioned.

320 **Table 1: Assumptions**

321 **3.3 Threats**

322 The threats in this chapter have been developed based on the following definition of  
 323 an attacker:

324 An attacker is a person who is trying to access sensitive information. His motivation is  
 325 to get able to copy or clone the TOE to compromise the whole financial system which  
 326 is secured by the TOE. However misuse of one single TOE in the way of generating  
 327 a TAC without the authorization of the owner of the card is not considered as an  
 328 attack. To perform his attack, the attacker has access to nearly unlimited resources  
 329 in terms of money and time. Therefore the attacker has a high attack potential in  
 330 terms of CC.

331

Threat name	Description
<b>T.HACK_PHYS</b> <i>Physical attacks through the TOE interfaces</i>	An attacker may obtain knowledge of cryptographic keys via physical attacks such as probing.
<b>T.LEAKAGE</b> <i>Leakage of information from the TOE</i>	An attacker may obtain TSF-data which is leaked from the TOE during normal usage. Leakage of information may occur through emanations, variations in power consumption, I/O characteristics, clock frequency, or by

Threat name	Description
	changes in processing time requirements.
<b>T.KEY_COMPROMISE</b> <i>Copying, releasing or unauthorized modification of the cryptographic keys</i>	An attacker may try to compromise the secret cryptographic key of the TOE. He may try to copy secret keys from the TOE using the user visible interfaces of the TOE. He may also try to use a brute force attack against the authentication mechanism of the administrator to overwrite or delete the key. An attacker may try to perform this attack during the usage phase of the TOE or during the key update process.
<b>T.KEY_DERIVE</b> <i>Derive the TAC key</i>	An attacker derives the TAC key from public known data, such as a TAC created by means of the TAC key or any other data communicated outside the TOE, which is a threat against the secrecy of the TAC key.
<b>T.INTEGRITY</b> <i>Integrity of security relevant data</i>	An attacker may change security relevant data in the storage of the TOE. Security relevant data includes cryptographic keys, TAC and DTBT.

332

**Table 2: Threats**333 **3.4 Organisational security policies**

OSP Name	Description
<b>OSP.TAC</b>	The TOE has to provide a function to generate a TAC over a DTBT. The TOE has to use a cryptographic operation to generate the TAC with the TAC key. The TAC is comparable to a digital signature while as the DTBT to the data to be signed.  The TAC generation has to include an automatically incremented unique serial number. The serial number participates in the TAC generation process to achieve that TAC calculation is not only based on DTBT but also the serial number.
<b>OSP.PIN</b>	In order to use the "TAC Generation" function of the TOE, the user of the TOE has to enter a PIN beforehand. This PIN is primarily thought of as a confirmation from the user. To perform more than one transaction the user has to enter the PIN only one time.  The TOE shall not provide any function to read out the PIN.
<b>OSP.KEY_UPDATE</b>	The TOE has to provide a secure communication channel and authentication to update cryptographic keys in a secure manner.

334

**Table 3: Organisational Security Policies**

## 335 4 Security Objectives

### 336 4.1 Security objectives for the TOE

Objective Name	Description
<b>SO.EMAN_DESIGN</b> <i>Provide physical emanations security</i>	The TOE has to be designed and built in such a way as to control the production of intelligible emanations within specified limits.
<b>SO.SELF_TEST</b> <i>Self Testing</i>	The TOE shall provide self-testing functionality for all TOE security functions which can detect flaws during pre-personalisation, personalisation and operational usage phases.
<b>SO.KEY_SECRECY</b> <i>Secrecy of the cryptographic keys</i>	The secrecy of <i>cryptographic keys</i> (e.g. the TAC key that is used for TAC generation) is reasonably assured against attacks with a high attack potential.
<b>SO.TAMPER_ID</b> <i>Tamper detection</i>	The TOE provides system features that detect physical tampering of a system component.
<b>SO.TAMPER_RESISTANCE</b> <i>Tamper resistance</i>	The TOE prevents or resists physical tampering with specified system devices and components.
<b>SO.KEY_UPDATE</b> <i>Secure updates of the cryptographic keys</i>	The TOE has to provide a secure mechanism to update <i>cryptographic keys</i> . This includes mechanisms to ensure the confidentiality and integrity of <i>cryptographic keys</i> transferred to the TOE as well as the authentication of the terminal which is sending the keys. The TOE shall provide safe destruction techniques for the cryptographic keys in case of key updates.
<b>SO.TAC_CONFIRM</b> <i>TAC generation function after confirmation only</i>	<p>The TOE provides the TAC generation function only after the user has entered his PIN for confirmation. For multiple TAC generations the user has to enter the PIN only one time.</p> <p>The TOE must not provide a function which would allow anybody to read out the PIN.</p>
<b>SO.TAC_SECURE</b> <i>Cryptographic security of the TAC</i>	<p>The TOE generates a TAC that cannot be forged without access to the TAC key through robust encryption techniques. The TAC key must not be reconstructible from publicly available data, such as a TAC or its DTBT.</p> <p>The TAC generation includes an automatically incremented unique serial number. The serial number participates in the TAC generation process to achieve that TAC calculation is not only based on DTBT but also based on this serial number.</p>

<b>SO.INTEGRITY</b> <i>Integrity Protection</i>	The TOE protects data in its storage against any unauthorized modification.
--	---

337

**Table 4: Security Objectives for the TOE**

338

#### 4.2 Security objectives for the environment

<b>Objective name</b>	<b>Description</b>
<b>SOE.PERSO</b>	<p>The Personalization and Pre-Personalization process must take place in an environment providing adequate physical security and performed by trustworthy personnel.</p> <p>Any data which is handled during these processes must be kept confidential.</p> <p>During key update, a secure CAD which is able to provide authentication and encryption has to be used.</p>
<b>SOE.KEY</b>	All cryptographic keys which are created in the environment to be used within the TOE have to be created and handled in a secure manner and have to have sufficient quality.
<b>SOE.DEVELOPMENT</b>	TOE development and test information during phases 1 and 2 is protected in a secure environment for its integrity and confidentiality. In case of delivery between different actors like IC manufacturer and embedded software manufacturer, this information is also protected in the same manner as aforementioned.

339

**Table 5: Security Objectives for the environment**

## 340 **5 IT Security Requirements**

341 This chapter gives the security functional requirements and the security assurance  
342 requirements for the TOE and the environment.

343 Security functional requirements components given in section 5.1 "TOE security  
344 functional requirements", excepting FPT\_EMAN.1 which is explicitly stated, are  
345 drawn from Common Criteria part 2 [CC]. Operations for assignment and selection  
346 have been made. Operations not performed in this PP are identified in order to  
347 enable instantiation of the PP to a Security Target (ST).

348 All operations which have been performed from the original text of part 2 of [CC]  
349 are written in *italics* for assignments and underlined for selections. Furthermore  
350 the [brackets] from part 2 of [CC] are kept in the text.

351 All operations which have to be completed by the ST author are marked with the  
352 words: "assignment" or "selection" respectively.

353 The TOE security assurance requirements statement given in section 5.2 "TOE  
354 Security Assurance Requirement" is drawn from the security assurance  
355 components from Common Criteria part 3 [CC].

356 Section 5.3 identifies the IT security requirements that are to be met by the IT  
357 environment of the TOE.

358 The non-IT environment is described in section 5.4

359 **5.1 TOE Security Functional Requirements**

360 The following table provides an overview about the used SFRs:

SFR	Description
FCS_CKM.4	Cryptographic key destruction
FCS_COP.1	Cryptographic operation
FDP_ACC.1/KEY	Subset access control for cryptographic keys
FDP_ACC.1/TAC	Subset access control for the TAC generation
FDP_ACF.1/KEY	Security attribute based access control for cryptographic keys
FDP_ACF.1/TAC	Security attribute based access control for the TAC generation
FDP_ITC.1	Import of user data without security attributes
FDP_RIP.1	Subset residual information protection
FDP_SDI.2	Stored data integrity monitoring and action
FDP_UCT.1	Basic data exchange confidentiality
FDP_UIT.1	Data exchange integrity
FIA_AFL.1/PIN	Authentication failure handling regarding the PIN
FIA_AFL.1/KEY	Authentication failure handling regarding the Key
FIA_ATD.1	User attribute definition
FIA_UAU.1	Timing of authentication
FIA_UAU.5	Multiple authentication mechanisms
FIA_UID.1	Timing of identification
FMT_MSA.1/TAC	Management of security attributes for TAC
FMT_MSA.1/KEY	Management of security attributes for keys
FMT_MSA.2	Secure security attributes
FMT_MSA.3/TAC	Static attribute initialisation for TAC
FMT_MSA.3/KEY	Static attribute initialisation for keys
FMT_MTD.1	Management of TSF data
FMT_SMF.1/PIN	Specification of Management Functions for PIN
FMT_SMF.1/KEY	Specification of Management Functions for TAC
FMT_SMR.1	Security roles
FPT_AMT.1	Abstract machine testing
FPT_EMAN.1	TOE Emanation
FPT_FLS.1	Failure with preservation of secure state
FPT_PHP.1	Passive detection of physical attack
FPT_PHP.3	Resistance to physical attack
FPT_TST.1	TSF testing
FTP_ITC.1	Inter-TSF trusted channel

361

362	5.1.1	Cryptographic support (FCS)	
363	5.1.1.1	Cryptographic key destruction (FCS_CKM.4)	
364	FCS_CKM.4.1	The TSF shall destroy cryptographic keys in accordance with a specified cryptographic key destruction method [ <i>assignment: cryptographic key destruction method</i> ] that meets the following:	
365			
366			
367			[ <i>assignment: list of standards</i> ].
368	<b>Application Note:</b>	It must be assured that cryptographic keys are destroyed securely e.g.	
369		by overwriting by new keys.	
370	5.1.1.2	Cryptographic operation (FCS_COP.1)	
371	FCS_COP.1.1	The TSF shall perform [ <i>TAC generation including a unique transaction serial number</i> ] in accordance with a specified cryptographic algorithm	
372			
373			[ <i>assignment: cryptographic algorithm</i> ] and cryptographic key sizes
374			[ <i>assignment: cryptographic key sizes</i> ] that meet the following: [ <i>listed in</i>
375			[ <i>FIPS_A</i> ].
376	Application Note:	TAC shall include an automatically incremented unique serial number.	
377		The serial number participates in the TAC generation process to	
378		achieve that TAC calculation is not only based on DTBT but also based	
379		on the serial number.	
380	5.1.2	User data protection (FDP)	
381	5.1.2.1	Subset access control (FDP_ACC.1)	
382	FDP_ACC.1.1/KEY	The TSF shall enforce the [ <i>Key Import/export SFP</i> ] on [ <i>subjects: user,</i>	
383		<i>objects: cryptographic keys and operation: import and export of keys</i> ].	
384	FDP_ACC.1.1/TAC	The TSF shall enforce the [ <i>TAC Generation SFP</i> ] on [ <i>subjects: user,</i>	
385		<i>objects: DTBT and operation: generate a TAC</i> ].	
386	5.1.2.2	Security attribute based access control (FDP_ACF.1)	
387	FDP_ACF.1.1/KEY	The TSF shall enforce the [ <i>Key Import/export SFP</i> ] to objects based on	
388		the following: [ <i>subject attribute: Administrator {yes/no} and object</i>	
389		<i>attribute: cryptographic key {yes/no}</i> ].	
390	FDP_ACF.1.2/KEY	The TSF shall enforce the following rules to determine if an operation	
391		among controlled subjects and controlled objects is allowed: [ <i>users</i>	
392		<i>with subject attribute administrator set to {yes} are allowed to update</i>	
393		<i>objects with attribute cryptographic key set to {yes}</i> ].	
394	FDP_ACF.1.3/KEY	The TSF shall explicitly authorise access of subjects to objects based	
395		on the following additional rules: [ <i>no other rule</i> ].	
396	FDP_ACF.1.4/KEY	The TSF shall explicitly deny access of subjects to objects based on	
397		the [ <i>rules</i> :	
398		Nobody is allowed to read out objects with attribute secret key set to	
399		{ <i>yes</i> }].	
400			
401	FDP_ACF.1.1/TAC	The TSF shall enforce the [ <i>TAC Generation SFP</i> ] to objects based on	
402		the following: [ <i>subject attribute: Cardholder {yes/no}, object attribute</i>	
403		<i>PIN {yes/no}</i> ].	
404	FDP_ACF.1.2/TAC	The TSF shall enforce the following rules to determine if an operation	
405		among controlled subjects and controlled objects is allowed: [ <i>users</i>	

406		<i>with subject attribute Cardholder set to {yes} are allowed to generate a</i>
407		<i>TAC for DTBT sent to the TOE].</i>
408	FDP_ACF.1.3/TAC	The TSF shall explicitly authorise access of subjects to objects based
409		on the following additional rules: [ <i>none</i> ].
410	FDP_ACF.1.4/TAC	The TSF shall explicitly deny access of subjects to objects based on
411		the [ <i>nobody is allowed to read out an object with attribute PIN set</i>
412		<i>{yes}</i> ].
413	5.1.2.3 Import of user data without security attributes (FDP_ITC.1)	
414	FDP_ITC.1.1	The TSF shall enforce the [ <i>Key Import/export SFP</i> ] when importing
415		user data, controlled under the SFP, from outside of the TSC.
416	FDP_ITC.1.2	The TSF shall ignore any security attributes associated with the user
417		data when imported from outside the TSC.
418	FDP_ITC.1.3	The TSF shall enforce the following rules when importing user data
419		controlled under the SFP from outside the TSC: [ <i>The key must only be</i>
420		<i>accepted when sent by an authorized administrator via the trusted</i>
421		<i>channel</i> ]
422	5.1.2.4 Subset residual information protection (FDP_RIP.1)	
423	FDP_RIP.1.1	The TSF shall ensure that any previous information content of a
424		resource is made unavailable upon the [ <i>selection: allocation of the</i>
425		<i>resource to, deallocation of the resource from</i> ] the following objects:
426		[ <i>cryptographic keys, PIN, [assignment: none or a list of objects]</i> ].
427	5.1.2.5 Stored data integrity monitoring and action (FDP_SDI.2)	
428	FDP_SDI.2.1	The TSF shall monitor user data stored within the TSC for [ <i>assignment:</i>
429		<i>integrity errors</i> ] on all objects, based on the following attributes
430		[ <i>assignment: user data attributes</i> ].
431	FDP_SDI.2.2	Upon detection of a data integrity error, the TSF shall [ <i></i>
432		<i>1. Prohibit the use of the altered data</i>
433		<i>2. Inform the user about integrity errors</i> ]
434	5.1.2.6 Basic data exchange confidentiality (FDP_UCT.1)	
435	FDP_UCT.1.1	The TSF shall enforce the [ <i>Key Import/export SFP</i> ] to be able to
436		[ <i>receive</i> ] objects in a manner protected from unauthorised disclosure.
437	5.1.2.7 Data exchange integrity (FDP_UIT.1)	
438	FDP_UIT.1.1	The TSF shall enforce the [ <i>Key Import/export SFP</i> ] to be able to
439		[ <i>receive</i> ] user data in a manner protected from [ <i>modification, insertion</i> ]
440		errors.
441	FDP_UIT.1.2	The TSF shall be able to determine on receipt of user data, whether
442		[ <i>modification, insertion</i> ] has occurred.

443	5.1.3	Identification and authentication (FIA)
444	5.1.3.1	Authentication failure handling (FIA_AFL.1)
445	FIA_AFL.1.1/PIN	The TSF shall detect when [ <u>an administrator configurable positive integer within 1 to 15</u> ] unsuccessful authentication attempts occur
446		related to [ <i>PIN based authentication of the Cardholder</i> ].
447		
448	FIA_AFL.1.2/PIN	When the defined number of unsuccessful authentication attempts has
449		been met or surpassed, the TSF shall [ <i>block the PIN based</i>
450		<i>authentication of the Cardholder</i> ].
451	<b>Application Note:</b>	Even though the PIN entry of the user is more seen as a confirmation
452		mechanism than as to be an authentication mechanism, this
453		mechanism is modelled using SFRs from class FIA.
454		
455	FIA_AFL.1.1/KEY	The TSF shall detect when [ <u>an administrator configurable positive</u>
456		<u>integer within 1 to 15</u> ] unsuccessful authentication attempts occur
457		related to [ <i>Key based authentication of the Administrator</i> ].
458	FIA_AFL.1.2/KEY	When the defined number of unsuccessful authentication attempts has
459		been met or surpassed, the TSF shall [ <i>block the Key based</i>
460		<i>authentication of the Administrator</i> ].
461	<b>Application Note:</b>	For the first assignment in FIA_AFL.1.1/PIN and FIA_AFL.1.1/KEY it
462		would also be acceptable if the number of allowed unsuccessful
463		authentication attempts is fixed and not configurable by the admin.
464		
465	5.1.3.2	User attribute definition (FIA_ATD.1)
466	FIA_ATD.1.1	The TSF shall maintain the following list of security attributes belonging
467		to individual users: [ <i>PIN, Cardholder {yes/no}, Administrator {yes/no},</i>
468		<i>number of unsuccessful authentication attempts</i> ]
469	5.1.3.3	Timing of authentication (FIA_UAU.1)
470	FIA_UAU.1.1	The TSF shall allow [ <i>assignment: list of TSF mediated actions</i> ] on
471		behalf of the user to be performed before the user is authenticated.
472	FIA_UAU.1.2	The TSF shall require each user to be successfully authenticated
473		before allowing any other TSF-mediated actions on behalf of that user.
474	<b>Application Note:</b>	The ST author must not specify one of the following TSF mediated
475		actions in the assignment of FIA_UAU.1.1:
476		1. TAC generation
477		2. Key update
478		3. Management functions provided by the TOE
479	5.1.3.4	Multiple authentication mechanisms (FIA_UAU.5)
480	FIA_UAU.5.1	The TSF shall provide [ <i>PIN based and Key based authentication</i>
481		<i>mechanisms</i> ] to support user authentication.
482	FIA_UAU.5.2	The TSF shall authenticate any user's claimed identity according to the
483		[ <i>PIN based authentication is used for authenticating a Cardholder and</i>
484		<i>Key based authentication is used for authenticating an Administrator</i> ].

485 5.1.3.5 Timing of identification (FIA\_UID.1)

486 FIA\_UID.1.1 The TSF shall allow [*assignment: list of TSF-mediated actions*] on  
487 behalf of the user to be performed before the user is identified.

488 FIA\_UID.1.2 The TSF shall require each user to be successfully identified before  
489 allowing any other TSF-mediated actions on behalf of that user.

490 **Application Note:** The ST author must not specify one of the following TSF mediated  
491 actions in the assignment of FIA\_UID.1.1:

- 492 1. TAC generation  
493 2. Key update  
494 3. Management functions provided by the TOE  
495

496 5.1.4 Security management (FMT)

497 5.1.4.1 Management of security attributes (FMT\_MSA.1)

498 FMT\_MSA.1.1/TAC The TSF shall enforce the [*TAC generation SFP*] to restrict the ability to  
499 [modify] the security attributes [*Cardholder {yes/no}*] to [*Cardholder*]

500

501 FMT\_MSA.1.1/KEY The TSF shall enforce the [*Key Import/export SFP*] to restrict the ability  
502 to [query, [set]] the security attributes [*administrator {yes/no}*,  
503 *cryptographic key {yes/no}*] to [*administrator*].

504 5.1.4.2 Secure security attributes (FMT\_MSA.2)

505 FMT\_MSA.2.1 The TSF shall ensure that only secure values are accepted for security  
506 attributes.

507 5.1.4.3 Static attribute initialisation (FMT\_MSA.3)

508 FMT\_MSA.3.1/TAC The TSF shall enforce the [*TAC generation SFP*] to provide [restrictive]  
509 default values for security attributes that are used to enforce the SFP.

510 FMT\_MSA.3.2/TAC The TSF shall allow the [*no roles*] to specify alternative initial values to  
511 override the default values when an object or information is created.

512

513 FMT\_MSA.3.1/KEY The TSF shall enforce the [*Key Import/export SFP*] to provide  
514 [restrictive] default values for security attributes that are used to  
515 enforce the SFP.

516 FMT\_MSA.3.2/KEY The TSF shall allow the [*no roles*] to specify alternative initial values to  
517 override the default values when an object or information is created.

518 5.1.4.4 Management of TSF data (FMT\_MTD.1)

519 FMT\_MTD.1.1 The TSF shall restrict the ability to [modify] the [*PIN*] to [*Cardholder or*  
520 *Administrator*].

521 5.1.4.5 Specification of Management Functions(FMT\_SMF.1)

522 FMT\_SMF.1.1/PIN The TSF shall be capable of performing the following security  
523 management functions: [*Modify the PIN, Set number of unsuccessful*  
524 *authentication attempts*].

525	FMT_SMF.1.1/KEY	The TSF shall be capable of performing the following security management functions: [ <i>query and set the security attributes of cryptographic key, start the self test of the TOE</i> ].
526		
527		
528	5.1.4.6 Security roles (FMT_SMR.1)	
529	FMT_SMR.1.1	The TSF shall maintain the roles [ <i>Administrator and Cardholder</i> ].
530	FMT_SMR.1.2	The TSF shall be able to associate users with roles.
531	5.1.5 Protection of the TSF (FPT)	
532	5.1.5.1 Abstract machine testing (FPT_AMT.1)	
533	FPT_AMT.1.1	The TSF shall run a suite of tests [ <u>during initial start-up, periodically during normal operation, at the request of an authorised user, [assignment: other conditions]</u> ] to demonstrate the correct operation of the security assumptions provided by the abstract machine that underlies the TSF.
534		
535		
536		
537		
538	5.1.5.2 TOE Emanation (FPT_EMAN.1)	
539	FPT_EMAN.1.1	The TOE shall not emit [ <i>assignment: types of emissions</i> ] in excess of [ <i>assignment: specified limits</i> ] enabling access to secret data including cryptographic keys, especially the TAC key.
540		
541		
542	FPT_EMAN.1.2	The TSF shall ensure that nobody is able to use [ <i>assignment: types of emissions</i> ] to gain access to secret data including cryptographic keys, especially the TAC key.
543		
544		
545	<b>Application Note:</b>	The TOE shall prevent attacks against cryptographic keys and other secret data where the attack is based on external observable physical phenomena of the TOE. Such attacks may be observable at the interfaces of the TOE or may origin from internal operation of the TOE or may origin by an attacker that varies the physical environment under which the TOE operates. The set of measurable physical phenomena is influenced by the technology employed to implement the TOE. Examples of measurable phenomena are variations in the power consumption, the timing of transitions of internal states, electromagnetic radiation due to internal operation, radio emission. Due to the heterogeneous nature of the technologies that may cause such emanations, evaluation against state-of-the-art attacks applicable to the technologies employed by the TOE is assumed. Examples of such attacks are, but are not limited to, evaluation of TOE's electromagnetic radiation, simple power analysis (SPA), differential power analysis (DPA), timing attacks, etc.
546		
547		
548		
549		
550		
551		
552		
553		
554		
555		
556		
557		
558		
559		
560		
561	5.1.5.3 Failure with preservation of secure state (FPT_FLS.1)	
562	FPT_FLS.1.1	The TSF shall preserve a secure state when the following types of failures occur: [ <i>assignment: list of types of failures in the TSF</i> ].
563		
564	5.1.5.4 Passive detection of physical attack (FPT_PHP.1)	
565	FPT_PHP.1.1	The TSF shall provide unambiguous detection of physical tampering that might compromise the TSF.
566		
567	FPT_PHP.1.2	The TSF shall provide the capability to determine whether physical tampering with the TSF's devices or TSF's elements has occurred.
568		

569	5.1.5.5 Resistance to physical attack (FPT_PHP.3)	
570	FPT_PHP.3.1	The TSF shall resist <i>[assignment: physical tampering scenarios]</i> to the
571		<i>[assignment: list of TSF devices/elements]</i> by responding automatically
572		such that the TSP is not violated.
573	5.1.5.6 TSF testing (FPT_TST.1)	
574	FPT_TST.1.1	The TSF shall run a suite of self tests <i>[selection: during initial start-up,</i>
575		<i>periodically during normal operation, at the request of the authorised</i>
576		<i>user, at the conditions [assignment: conditions under which self test</i>
577		<i>should occur]</i> to demonstrate the correct operation of the TSF.
578	FPT_TST.1.2	The TSF shall provide authorised users with the capability to verify the
579		integrity of TSF data.
580	FPT_TST.1.3	The TSF shall provide authorised users with the capability to verify the
581		integrity of stored TSF executable code.
582	<b>Application Note:</b>	According to SO.SELF_TEST, TOE self-test should be provided for
583		pre-personalisation, personalisation and operational usage phases.
584	5.1.6 Trusted path/channels (FTP)	
585	5.1.6.1 Inter-TSF trusted channel (FTP_ITC.1)	
586	FTP_ITC.1.1	The TSF shall provide a communication channel between itself and a
587		remote trusted IT product that is logically distinct from other
588		communication channels and provides assured identification of its end
589		points and protection of the channel data from modification or
590		disclosure.
591	FTP_ITC.1.2	The TSF shall permit <i>[selection: the TSF, the remote trusted IT</i>
592		<i>product]</i> to initiate communication via the trusted channel.
593	FTP_ITC.1.3	The TSF shall initiate communication via the trusted channel for <i>[import</i>
594		<i>of cryptographic key, [assignment: any other functions for which a</i>
595		<i>trusted channel is required]</i> .

596 **5.2 TOE Security Assurance Requirements**

597 The evaluation assurance package is EAL 4 augmented by AVA\_VLA.4 and  
598 ADV\_IMP.2.

## 599 5.3 Security Requirements for the IT Environment

### 600 5.3.1 Cryptographic key generation

#### 601 5.3.1.1 Cryptographic key generation (FCS\_CKM.1/ENV)

602 FCS\_CKM.1.1/ENV The TSF shall generate cryptographic keys in accordance with a  
603 specified cryptographic key generation algorithm [assignment:  
604 cryptographic key generation algorithm] and specified cryptographic  
605 key sizes [assignment: cryptographic key sizes] that meet the following:  
606 [assignment: list of standards].

#### 607 5.3.1.2 Basic data exchange confidentiality (FDP\_UCT.1/ENV)

608 FDP\_UCT.1.1/ENV The TSF shall enforce the [assignment: access control SFP(s)  
609 and/or information flow control SFP(s)] to be able to [transmit]  
610 objects in a manner protected from unauthorised disclosure.

#### 611 5.3.1.3 Data exchange integrity (FDP\_UIT.1/ENV)

612 FDP\_UIT.1.1/ENV The TSF shall enforce the [assignment: access control SFP(s)  
613 and/or information flow control SFP(s)] to be able to [transmit] user  
614 data in a manner protected from [modification, insertion] errors.

615 FDP\_UIT.1.2/ENV The TSF shall be able to determine on receipt of user data,  
616 whether [modification, insertion] has occurred.

617

#### 618 5.3.1.4 Inter-TSF trusted channel (FTP\_ITC.1/ENV)

619 FTP\_ITC.1.1/ENV The TSF shall provide a communication channel between itself and a  
620 remote trusted IT product that is logically distinct from other  
621 communication channels and provides assured identification of its end  
622 points and protection of the channel data from modification or  
623 disclosure.

624 FTP\_ITC.1.2/ENV The TSF shall permit *[selection: the TSF, the remote trusted IT*  
625 *product]* to initiate communication via the trusted channel.

626 FTP\_ITC.1.3/ENV The TSF shall initiate communication via the trusted channel for  
627 *[export of cryptographic key, [assignment: any other functions for*  
628 *which a trusted channel is required]]*.

629

630 Note that the dependencies of the security requirements in the environment have not  
631 been considered.

632 To identify the SFRs mentioned in this chapter as SFRs for the environment the  
633 identifiers from part II of [CC] have been modified with a suffix.

634

## 635 5.4 Security Requirements for the Non-IT Environment

### 636 5.4.1 R.Personalization

637 The Personalization and Pre-Personalization process must take place in an  
638 environment providing adequate physical security and performed by trustworthy  
639 personnel.

640 Any data which is handled during these processes have to be kept confidential.

641 **5.4.2 R.Key\_Protection**

642 All cryptographic keys which are created in the environment to be used within  
643 the TOE have to be handled in a secure manner.

644 **5.4.3 R.Development**

645 TOE development and test information during phases 1 and 2 must be protected  
646 in a secure environment for its integrity and confidentiality. In case of delivery  
647 between different actors like IC manufacturer and embedded software  
648 manufacturer, this information must be also protected in the same manner as  
649 aforementioned.

650 **6 Rationale**

651 **6.1 Security objectives rationale**

Threats, Assumptions, OSP / Security Objectives	SO.EMAN_DESIGN	SO.SELF_TEST	SO.KEY_SECRECY	SO.TAMPER_ID	SO.TAMPER_RESISTANCE	SO.KEY_UPDATE	SO.TAC_CONFIRM	SO.TAC_SECURE	SO.INTEGRITY	SOE.PERSO	SOE.KEY	SOE.DEVELOPMENT
T.HACK_PHYS				X	X							
T.LEAKAGE	X											
T.KEY_COMPROMISE		X	X			X				X		
T.KEY_DERIVE		X						X				
T.INTEGRITY		X							X			
OSP.TAC		X						X				
OSP.PIN		X					X					
OSP.KEY_UPDATE		X				X						
A.PERSO										X		
A.KEY											X	
A.DEVELOPMENT												X

652 **Table 6: Security Objectives Rationale**

653 **6.1.1 Coverage of the Security Objectives**

654 **SO.EMAN\_DESIGN** can be traced back to the threats **T.LEAKAGE** as the  
 655 design which is described in **SO.EMAN\_DESIGN** prevents any emanations  
 656 which could be used to perform **T.LEAKAGE**.

657 **SO.SELF\_TEST** can be traced back to many threats as it is supporting all  
 658 security functions which are provided by the TOE because it ensures that these  
 659 functions are working correctly.

660 **SO.KEY\_SECRECY** can be traced back to the threats **T.KEY\_COMPROMISE**  
 661 as **SO.KEY\_SECRECY** describes that the confidentiality of the cryptographic  
 662 keys has to be ensured by the TOE.

663 **SO.TAMPER\_ID** can be traced back to the threats **T.HACK\_PHYS** as one have  
 664 to identify an attack via physical means before one is able to handle this attack.

665 **SO.TAMPER\_RESISTANCE** can be traced back to the threats **T.HACK\_PHYS**  
 666 as **SO\_TAMPER\_RESISTANCE** defines that the TOE has to prevent or resist  
 667 physical hacking as described in **T.HACK\_PHYS**.

668 **SO.KEY\_UPDATE** can be traced back to the threats **T.KEY\_COMPROMISE** as  
669 it ensures that the confidentiality of the cryptographic key is ensured when  
670 transmitted to the TOE and **OSP.KEY\_UPDATE** as this objective describes the  
671 functionality as required by the OSP.

672 **SO.TAC\_CONFIRM** can directly be traced back to the **OSP.PIN**.

673 **SO.TAC\_SECURE** can be traced back to **OSP.TAC** as it describes the  
674 requirements from the OSP and to the threat **T.KEY\_DERIVE** as the  
675 mechanism as described in **SO.TAC\_SECURE** are used to block the possibility  
676 to gain knowledge of the secret keys with public knowledge.

677 **SO.INTEGRITY** can obviously be traced back to **T.INTEGRITY**.

#### 678 6.1.2 Coverage of the assumptions

679 **A.PERSO** is obviously covered by **SOE.PERSO**.

680 **A.KEY** is obviously covered by **SOE.KEY**.

681 **A.DEVELOPMENT** is obviously covered by **SOE.DEVELOPMENT**.

682 All the security objectives for the environment are stated in a way that it is  
683 obvious that they are suitable to fulfil the assumption.

#### 684 6.1.3 Countering the threats

685 **SO.SELF\_TEST** is a supportive security objective which is enlisted against  
686 many threats. It will therefore not be explicitly mentioned in the following  
687 paragraphs. It ensures that the security functions which are provided by the  
688 TOE are working correctly and is therefore a supportive objective for all threats  
689 which are actively blocked by functions of the TOE.

690 **T.HACK\_PHYS** is covered by **SO.TAMPER\_ID** which detects physical  
691 tampering and **SO.TAMPER\_RESISTANT** which requires that the TOE has to  
692 be resistant against this kind of attacks.

693 **T.LEAKAGE** is obviously covered by **SO\_EMAN\_DESIGN**.

694 **T.KEY\_COMPROMISE** is covered by **SO.KEY\_SECRECY** which secures the  
695 cryptographic keys when stored in the TOE and **SO.KEY\_UPDATE** which  
696 protects the key when transmitted to the TOE. Furthermore **SOE.PERSO**  
697 supports the blocking of this threat as it ensures that the confidentiality of the  
698 key is ensured during the perso- or update process.

699 **T.KEY\_DERIVE** is directly covered by **SO.TAC\_SECURE** as this objective  
700 defines that any algorithm which is used to calculate the TAC has to ensure that  
701 it is not feasible to derive the secret key from any publicly available data.

702 **T.INTEGRITY** is directly covered by **SO.INTEGRITY** as it is not feasible for an  
703 attacker to change any kind of security relevant data as long as the TOE  
704 protects its data against unauthorized modification.

#### 705 6.1.4 Coverage of the Organisational Security Policies

706 **OSP.TAC** is obviously covered by **SO.TAC\_SECURE**.

707 **OSP.PIN** is obviously covered by **SO.TAC\_CONFIRM**.

708        **OSP.KEY\_UPDATE** is obviously covered by **SO.KEY\_UPDATE**.  
709        All these security objectives are stated in a way that it is obvious that they are  
710        suitable to fulfil the OSP.

711 **6.2 Security requirements rationale**

712 6.2.1 Suitability of minimum strength of function (SoF) level

713 The TOE shall be highly resistant against penetration attacks in order to meet  
714 the security objectives. The protection against attacks with a high attack  
715 potential dictates a strength of function rating of “high”. This SoF claim is only  
716 applicable to functions in the TOE which are realised using probabilistic or  
717 permutational mechanisms.

718 6.2.2 Fulfilment of TOE objectives by the TOE functional requirements

	SO.EMAN_DESIGN	SO.SELF_TEST	SO.KEY_SECRECY	SO.TAMPER_ID	SO.TAMPER_RESISTANCE	SO.KEY_UPDATE	SO.TAC_CONFIRM	SO.TAC_SECURE	SO.INTEGRITY

719

720

721 **SO.EMAN\_DESIGN** which requires that the TOE is built in such a way as to  
722 control the production of intelligible emanations within specified limits is directly  
723 fulfilled by the **SFR FPT\_EMSEC.1** as this requires that the TOE does not emit  
724 intelligible emanations which exceed a certain limit and that it shall not be  
725 possible to determine user data of the TOE using these emanations.

726 **SO.SELF\_TEST** which requires that the TOE has to provide self testing  
727 functionality for all security functions is fulfilled by a combination of **FPT\_AMT.1**  
728 describes that the TOE has to provide a test for the hardware the TOE is relying  
729 on and **FPT\_TST.1** which describes that the TOE has to be able to run a suite of  
730 tests to ensure the correct operation of the TSF.

731 **SO.KEY\_SECRECY** which describes that the TOE assures the TAC key against  
732 attacks is fulfilled by **FCS\_CKM.4** which ensures the secure destruction of the  
733 keys after an update has been performed, **FDP\_ACC.1/KEY** and  
734 **FDP\_ACF.1/KEY** which specify that nobody is allowed to read out the key,  
735 **FDP\_RIP.1** which ensures that key in memory which are no longer used are  
736 destroyed, **FDP\_SDI.2** which specifies the integrity protection of the key and  
737 **FPT\_FLS.1** which detects insecure states of the TOE. Furthermore  
738 **FPT\_EMAN.1** contributes to **SO.KEY\_SECRECY** as the design of the TOE  
739 which is described in **FPT\_EMAN.1** is used to protect the key.

740 **SO.TAMPER\_ID** which requires that the TOE detects physical tampering  
741 directly and completely covered by **FPT\_PHP.1**.

742 **SO.TAMPER\_RESISTANCE** which requires that the TOE has to be resistant  
743 against physical tampering is directly and completely covered by **FPT\_PHP.3**.

744 **SO.KEY\_UPDATE** specifies that the TOE has to provide a secure mechanism  
745 to update the key. This includes the secure transmission to the TOE, the  
746 authentication of the terminal which is sending the key and the secure  
747 destruction of old keys.

748 This objective is fulfilled by a combination of **FCS\_CKM.4** which describes the  
749 secure key destruction method after the key update has been performed,  
750 **FDP\_ACC.1/KEY** and **FDP\_ACF.1/KEY** which define that only an administrator  
751 is allowed to update the keys, **FDP\_ITC.1** which defines the import policy for the  
752 key update, **FDP\_UCT.1** which describes that the keys have to be kept  
753 confidential during key update, **FDP\_UIT.1** which describes that the TOE has to  
754 ensure the integrity of the keys, **FIA\_AFL.1/KEY** which ensures that the process  
755 of key update is blocked after a certain number of unsuccessful authentication  
756 attempts, **FIA\_UAU.1** and **FIA\_UAU.5** which describe the authentication  
757 mechanisms of the terminal, **FIA\_UID.1** which requires user identification,  
758 **FMT\_MSA.1/KEY** which limits the ability to change security attributes for key  
759 update to administrators, **FMT\_MSA.3/KEY** which defines that nobody is  
760 allowed to overwrite the initial values for the security attributes,  
761 **FMT\_SMF.1/KEY** which defines the management functions for the key update,  
762 **FMT\_SMR.1** which describes the roles, the TOE has to maintain and  
763 **FPT\_ITC.1** which describes the requirements for the trusted channel which also  
764 include terminal authentication.

765 **SO.TAC\_CONFIRM** describes that the TOE has to provide a confirmation  
766 mechanism which requires the user to confirm the TAC generation. In terms of  
767 SFRs this mechanism is modelled as an authentication mechanism as follows:

768 **FDP\_ACC.1/TAC** and **FDP\_ACF.1/TAC** describe the rules for access control  
 769 related to the TAC generation and the PIN, **FDP\_RIP.1** defines that PINs which  
 770 are no longer used are securely destroyed from memory, **FIA\_AFL.1/PIN**  
 771 defines the authentication failure handling for the TAC generation, **FIA\_ATD.1**  
 772 defines the user attributes which are used for access control, **FIA\_UAU.1**,  
 773 **FIA\_UAU.5** and **FIA\_UID.1** describe the multiple authentication mechanisms  
 774 and that each user has to be identified/authenticated before he is allowed to  
 775 generate the TAC, **FMT\_MSA.1/TAC** defines that nobody is allowed to change  
 776 the security attribute regarding the card holder, **FMT\_MTD.1** defines that only  
 777 the card holder and an administrator are allowed to change the PIN,  
 778 **FMT\_SMF.1/PIN** defines the management function to change the PIN and  
 779 **FMT\_SMR.1** describes the roles, the TOE has to maintain.

780 **SO.TAC\_SECURE** which requires that the TAC which is generated by the TOE  
 781 cannot be forged is covered by a combination of **FCS\_COP.1** which defines the  
 782 cryptographic operation to generate the TAC, **FDP\_SDI.2** which is used to  
 783 ensure the integrity of the data which is used to generate the TAC,  
 784 **FMT\_MSA.1/TAC**, **FMT\_MSA.3/TAC** and **FMT\_MSA.2** which describe the  
 785 handling of the security attributes which are involved in the TAC generation,  
 786 **FPT\_AMT.1** to ensure the correct operation of the function to generate a TAC.

787 **SO.INTEGRITY** which requires that the TOE protects that data in its storage  
 788 against unauthorized modification is covered by **FDP\_ACC.1/KEY** which  
 789 describes the access control policy for the cryptographic keys together with  
 790 **FDP\_ACF.1/KEY** and **FDP\_ACC.1/TAC** which describes the access control  
 791 policy together with **FDP\_ACF.1/TAC** for the TAC. Beside these requirements  
 792 which are used to decide whether an access attempt to an asset is authorized,  
 793 **FDP\_SDI.2** is used to ensure the integrity of data when stored in the memory of  
 794 the TOE.

795

796 6.2.3 Fulfilment of IT environment objectives by the IT environment functional  
 797 requirements

	SOE.PERSO	SOE.KEY
FCS_CKM.1/ENV		X
FDP_UCT.1/ENV	X	
FDP_UIT.1/ENV	X	
FTP_ITC.1/ENV	X	

798

799 Only **SOE.PERSO** and **SOE.KEY** contain requirements for the IT-environment.  
 800 The requirements for the key out of **SOE.KEY** are directly and completely  
 801 covered by **FCS\_CKM.1/ENV**.

802 The requirements from **SOE.PERSO** are covered by a combination of  
 803 **FDP\_UCT.1/ENV** which deals with the confidentiality of data and

804 **FDP\_UIT.1/ENV** and **FTP\_ITC.1/ENV** which describe the requirements for the  
805 trusted channel.

#### 806 6.2.4 Mutual support and internal consistency of security requirements

807 From the details given in this rationale it becomes evident that the functional  
808 requirements form an integrated whole and, taken together, are suited to meet  
809 all security objectives. Requirements from [CC] part 2 are used to fulfil the  
810 security objectives.

811 The core TOE functionality is represented by the requirements for TAC  
812 generation, the handling of the key and the mechanisms for key update.  
813 (FCS\_CKM.4, FCS\_COP.1, FTP\_ITC.1)

814 Furthermore a set of requirements is used to describe the way these functions  
815 should be used and who is allowed to use them (e.g. FDP\_ACC.1/KEY)

816 In the end this PP contains a set of SFRs which deals with the detection and  
817 defeating of attacks to the TOE, resp. SFRs which are used to show that the  
818 TOE is working correctly (e.g. FPT\_PHP.1, FPT\_PHP.3, FPT\_TST.1)

819 Therefore it becomes clear that the SFRs in this PP mutually support each other  
820 and form a consistent whole.

821 6.2.5 Fulfilment of TOE SFR dependencies

SFR	Dependencies	Dependency fulfilled?
FCS_CKM.4	FDP_ITC.1, FMT_MSA.2	Yes
FCS_COP.1	FDP_ITC.1, FCS_CKM.4, FMT_MSA.2	Yes
FDP_ACC.1/KEY	FDP_ACF.1	Yes
FDP_ACC.1/TAC	FDP_ACF.1	Yes
FDP_ACF.1/KEY	FDP_ACC.1, FMT_MSA.3	Yes

822

823 **6.2.6 Appropriateness of TOE assurance requirements**

824 The assurance level for this protection profile is EAL4 augmented. EAL4 allows a developer  
825 to attain a reasonably high assurance level without the need for highly specialized processes  
826 and practices.

827  
828 It is considered to be the highest level that could be applied to an existing product line  
829 without undue expense and complexity. As such, EAL4 is appropriate for commercial  
830 products that can be applied to moderate to high security functions.

831  
832 The TOE described in this protection profile is just such a product. Augmentation results from  
833 the selection of:

834

835 **AVA\_IMP.2** Implementation of the TSF

836 **AVA\_VLA.4** Vulnerability Assessment - Vulnerability Analysis – Highly resistant

837

838 The main function of the TOE is to protect the cryptographic key which is used to generate  
839 the TAC. If an attacker would get knowledge of one or more of these keys, the whole  
840 financial system in which the TOE is used may become insecure. Therefore it is reasonable  
841 to assume a high attack potential for an attacker and to augment EAL 4 by **AVA\_VLA.4**.

842

843 AVA\_VLA.4 has the following dependencies:

844

- 845 • ADV\_FSP.1 Informal functional specification
- 846 • ADV\_HLD.2 Security enforcing high-level design
- 847 • ADV\_IMP.1 Subset of the implementation of the TSF
- 848 • ADV\_LLD.1 Descriptive low-level design
- 849 • AGD\_ADM.1 Administrator guidance
- 850 • AGD\_USR.1 User guidance

851

852 All of these are met or exceeded in the EAL4 assurance package.

853

854 The augmentation by **ADV\_IMP.2** requests that the evaluator reviews the complete  
855 implementation of the TSF. This is useful as an additional input for AVA\_VLA.4 as the  
856 evaluation gains knowledge about the complete internal structure of the TOE and is able to  
857 use this knowledge for AVA\_VLA.4. Therefore it is reasonable to augment EAL4 by

858 **ADV\_IMP.2**.

859

860 ADV\_IMP.2 has the following dependencies:

861

- 862 • ADV\_LLD.1 Descriptive low-level design
- 863 • ADV\_RCR.1 Informal correspondence demonstration
- 864 • ALC\_TAT.1 Well-defined development tools

865

866 All of these are met or exceeded in the EAL4 assurance package.

867

867 **6.3 Rationale for Extensions**

868 Remarks: Definition of this family is based on the FPT\_EMSEC of the SSCD PP  
869 [SSCD].

870 The additional family FPT\_EMAN (TOE Emanation) of the Class FPT (Protection  
871 of the TSF) is defined here to describe the IT security functional requirements of  
872 the TOE. The TOE shall prevent attacks against the cryptographic keys and other  
873 secret data where the attack is based on external observable physical  
874 phenomena of the TOE. Examples of such attacks are evaluation of TOE's  
875 electromagnetic radiation, simple power analysis (SPA), differential power  
876 analysis (DPA), timing attacks, etc. This family describes the functional  
877 requirements for the limitation of intelligible emanations.

### 878 6.3.1 FPT\_EMAN TOE Emanation

879 Family behaviour

880 This family defines requirements to mitigate intelligible emanations.

881 Component levelling:

882

883

884 FPT\_EMAN.1 TOE Emanation has two constituents:

- 885 • FPT\_EMAN.1.1 Limit of Emissions requires to not emit intelligible emissions enabling  
886 access to TSF data or user data.
- 887 • FPT\_EMAN.1.2 Interface Emanation requires not emit interface emanation enabling  
888 access to TSF data or user data.

889

890 Management: FPT\_EMAN.1

891 There are no management activities foreseen.

892 Audit: FPT\_EMAN.1

893 There are no actions identified that should be auditable if FAU\_GEN Security audit data  
894 generation is included in the PP/ST.

#### 895 6.3.1.1 TOE Emanation (FPT\_EMAN.1)

896 FPT\_EMAN.1.1 The TOE shall not emit [*assignment: types of emissions*] in excess  
897 of [*assignment: specified limits*] enabling access to secret data  
898 including cryptographic keys, especially the TAC key.

899 FPT\_EMAN.1.2 The TSF shall ensure that nobody is able to use [*assignment:*  
900 *types of emissions*] to gain access to secret data including  
901 cryptographic keys, especially the TAC key.

902 Hierarchical to: No other components.

903 Dependencies: No other components.

904

905 **7 Appendix**

906 **7.1 Abbreviations**

907 7.1.1 TOE related abbreviations

Abbreviation	Explanation
AEF	Active Elementary File
